#### Production Note

Cornell University Library produced this volume to replace the irreparably deteriorated original. It was scanned using Xerox software and equipment at 600 dots per inch resolution and compressed prior to storage using CCITT Group 4 compression. digital data were used to create Cornell's replacement volume on paper that meets the ANSI Standard Z39.48-1984. The production of this volume was supported in part by the Commission on Preservation and Access and the Xerox Corporation. Digital file copyright by Cornell University Library 1991.

## A NEW THEORY OF JUPITER AND SATURN

(ASTRONOMICAL PAPERS OF THE AMERICAN EPHEMERIS, Vol. IV.)

| INTRODUCTION.  | Page.        |
|--|--------------|
| History of previous attempts at the solution of this problem   | 11<br>14     |
| CHAPTER I. MUTUAL ACTION OF JUPITER AND SATURN. DEVELOPMENT OF THE RECIPROCAL OF THE DISTANCE BETWEEN THE PLANETS AND ITS ODD POWERS IN PERIODIC SERIES WHEN ELLIPTIC VALUES ARE SUBSTITUTED FOR THE CO-ORDINATES. |              |
| Elements of Jupiter and Saturn adopted   | 19           |
| Correction of the semi-axes for the constant terms of the radii vectores   | 20           |
| Relative position of the planes of the orbits  |              |
| Degree of accuracy required in the developments  |              |
| Value of certain constants employed in the developments  |              |
| Separation of the distance into factors  | 24           |
| Values of the Laplace coefficients $b_{\bullet}^{(4)}$ for the sixteen points of the circumference   | 26           |
| Formulæ and values belonging to the development of the second factor of the distance   | 32           |
| Values of certain coefficients for the first power of the reciprocal of the distance   | 38           |
| The similar coefficients for the third power   | 40           |
| The similar coefficients for the fifth power   |              |
| The similar coefficients for the seventh power   |              |
| Application of mechanical quadratures to these coefficients  | 44<br>45     |
| Expressions of the odd powers of the reciprocal of the distance in terms of the mean anomaly of Saturn and th  |              |
| eccentric of Jupiter   | 46           |
| Values of the Besselian functions corresponding to multiples of the eccentricities of Jupiter and Saturn   | 51           |
| Expressions of the odd powers of the reciprocal of the distance in terms of the mean anomalies of both planets .   | 53           |
| CHAPTER II. PERTURBATIONS OF JUPITER AND SATURN ARISING FROM THEIR MUTUAL ACTION AND OF THE FIRST ORDER WITH RESPECT TO DISTURBING FORCES.   | <u>.</u>     |
| Values of four factors required in obtaining the forces  | 59           |
| Products of the cube of the reciprocal of the distance by these factors  | . 60         |
| Developments of the reactions of Jupiter and Saturn on the Sun   | . 63         |
| Expressions for the three functions denoting the action of Saturn on Jupiter   | . 66         |
| The same relative to the action of Jupiter on Saturn   | . 69         |
| Expressions for the multipliers A, B, and C for Jupiter and A', B', and C' for Saturn  | . 72<br>· 74 |
| Values of the constants $\eta$ and $\theta$  | 74           |
| Developments of the similar functions for Saturn   | . 83         |
| Values of the integrating factors for Jupiter  | . 92         |
| Values of the similar factors for Saturn   | . 93         |
| Illustration of the method of forming $\overline{W}$ and $\overline{W'}$   | . 94         |
| Values assumed for the arbitrary constants   | . 94         |
| Expressions for the differentials of $\delta z$ and $v$  | . 96         |
| Expressions for the differentials of $\delta z'$ and $v'$  | . 98         |
| Formulæ for the secular portions of the six co-ordinates of Jupiter and Saturn   | . 101        |
| Expressions for the perturbations of the co-ordinates of Jupiter   | . 103        |
| Expressions for the perturbations of the co-ordinates of Saturn  | . 100        |

| CHAPTER III. PERTURBATIONS OF SATURN BY URANUS OF THE FIRST ORDER WITH RESPECT TO THE DISTURBING FORCE.  |
|--|
| Adopted elements of Uranus  Values of certain constants employed in the developments  Values of certain quantities for twelve points of the circumference with respect to the mean anomaly of Uranus  Values of the Laplace coefficients books of the reciprocal of the distance  Values of the A for the first power of the reciprocal of the distance  The similar coefficients for the third power  The similar coefficients for the fifth power  The similar coefficients for the fifth power  Application of mechanical quadratures to these coefficients  Expressions of the odd powers of the reciprocal of the distance in terms of the mean anomaly of Uranus and the eccentric of Saturn  The same in terms of the mean anomalies of both planets  Values of Besselian functions corresponding to the eccentricity of Uranus  Products of the cube of the reciprocal of the distance by three factors  Expressions for the reaction of Uranus on the Sun  Expressions for the three functions denoting the action of Uranus on Saturn  Expression for the differential of R  Values of the integrating factors  Expression for the differential of dz and v  Expressions for the perturbations of the co-ordinates of Saturn |
| CHAPTER IV. PERTURBATIONS OF JUPITER BY URANUS OF THE FIRST ORDER WITH RESPECT TO DISTURBING FORCES.   |
| Values of certain constants employed in the developments  Values of certain quantities for twelve points of the circumference in reference to the mean anomaly of Uranus  Values of the a  |
| CHAPTER V. PERTURBATIONS OF SATURN BY NEPTUNE.  Elements of Neptune and resulting constants  Values of certain quantities for twelve points of the circumference with reference to the mean anomaly of Neptune.  Values of the a.  Values of the A for two powers of the reciprocal of the distance  Expressions of the odd powers of the distance in terms of the mean anomaly of Neptune and the eccentric of Saturn  The same in terms of the mean anomalies of both planets  Products of the cube of the reciprocal of the distance by two factors  Expressions for the reaction of Neptune on the Sun  Expressions for the three functions which denote the action of Neptune on Saturn  Expressions for T and the differential of R  Values of the integrating factors  Expressions for the differentials of $\delta z$ and $v$  |
| Expressions for the perturbations of the co-ordinates of Saturn  |
| Values of constants employed in the developments  Values of quantities for eight points of the circumference in reference to the mean anomaly of Neptune   |

| CHAPTER VI. PERTURBATIONS OF JUPITER BY NEPTUNE—Continued.  |   |
|---|---|
| The same in terms of the mean anomalies of both planets.  Values of Besselian functions corresponding to the eccentricity of Neptune  Products of the cube of the reciprocal of the distance by two factors  Expression of the reaction of Neptune on the Sun  Expressions of the three functions denoting the action of Neptune on Jupiter  Expressions for T and the differential of R  Values of the integrating factors  Expressions for the differentials of dz and v  Expressions for the perturbations of the co-ordinates of Jupiter.   | 184<br>185<br>186<br>187<br>187<br>189<br>190<br>190  |
| CHAPTER VII. PERTURBATIONS OF JUPITER AND SATURN BY THE FOUR INTERIOR PLANETS.  |   |
| Adopted values of the elements Action of Mercury on Jupiter Action of Venus on Jupiter Action of the Earth on Jupiter Action of Mars on Jupiter Action of Mercury on Saturn Action of Venus on Saturn Action of the Earth on Saturn Action of the Earth on Saturn Action of Mars on Saturn CHAPTER VIII. PERTURBATIONS OF THE SECOND ORDER WITH RESPECT TO DISTURBING   | 192<br>193<br>194<br>195<br>196<br>196<br>197   |
| FORCES IN THE LONGITUDES AND RADII VECTORES ARISING FROM THE MUTUAL ACTION OF JUPITER AND SATURN. DERIVATION OF THE FACTORS OF &T AND &T'.  |   |
| The eight terms of $\delta T$ and $\delta T'$ Formulæ for the eight factors  Products of the fifth power of the reciprocal of the distance by four factors  Expressions for the reactionary terms  Expressions for four derivatives of the perturbative function for Jupiter  The similar quantities for Saturn  The two multipliers M and N, and their values for Jupiter and Saturn  Expressions for the factors V, X, B, and G  Expression for $\overline{T}$ Expressions for the factors C, D, E, and H  Expressions for the factors V', X', B', and G'  Expressions for the factors C', D', E', and H'  Expressions for two of the secondary factors of $\delta T$ Expressions for two of the secondary factors of $\delta T'$ | 199<br>199<br>202<br>204<br>205<br>208<br>211<br>212<br>220<br>221<br>228<br>236<br>237<br>244<br>246 |
| Chapter IX. CALCULATION OF THE TERMS OF $\delta$ T AND $\delta$ T' WHOSE ARGUMENTS ARE $\gamma$ AND $\gamma'$ .   |   |
| Reasons for including portions of the third-order terms in those of the second order  | 249<br>250<br>251<br>252<br>253   |
| CHAPTER X. CALCULATION OF THE PORTION OF ST NOT FACTORED BY nt.   |   |
| Value of limits for neglecting terms  | 255<br>255  |
| CHAPTER XI. CALCULATION OF THE PORTION OF ST FACTORED BY nt.  |   |
| Degree of precision adopted   | 262<br>262  |
| CHAPTER XII. SECOND-ORDER PERTURBATIONS OF THE MEAN ANOMALY AND RADIUS-VECTOR OF JUPITER ARISING FROM THE MUTUAL ACTION OF THIS PLANET AND SATURN.  |   |
| Sum of the eight portions of $\delta T$   | 269<br>274<br>2 <b>7</b> 6<br>281   |

| CHAPTER XII. SECOND-ORDER PERTURBATIONS, ETC.—Continued.   |
|--|
| Expression for the supplementary quantity of the differential of $\delta \nu$  |
| CHAPTER XIII. CALCULATION OF THE PORTION OF ST' NOT FACTORED BY n't.   |
| Limits for neglecting terms  |
| CHAPTER XIV. CALCULATION OF THE PORTION OF ST' FACTORED BY n't.  |
| Degree of precision employed   |
| CHAPTER XV. SECOND-ORDER PERTURBATIONS OF THE MEAN ANOMALY AND RADIUS-VECTOR OF SATURN, ARISING FROM THE MUTUAL ACTION OF THIS PLANET AND JUPITER.   |
| Sum of the eight portions of $\delta T'$ .  Special treatment of long-period terms in integration.  Expressions for $\overline{\delta W_0}'$ and its $\gamma'$ derivative.  Expressions for the two supplementary quantities completing the differential of $n'\delta^2z'$ .  Expression for the supplementary quantities completing the differential of $\delta v'$ .  The modification of the great inequality by second-order terms.  The modification of the constant term of $\nu'$ by second-order terms.  The modification of the long-period inequality in $\nu'$ .  Expressions for $n'\delta^2z'$ and $\nu'$ .   |
| CHAPTER XVI. PERTURBATIONS OF THE THIRD ORDER WITH RESPECT TO DISTURBING FORCES IN THE LONGITUDES AND RADII VECTORES ARISING FROM THE MUTUAL ACTION OF JUPITER AND SATURN. DETERMINATION OF THE FACTORS OF &T AND &T'.   |
| The terms retained of \$\delta^3\text{T}\$ and \$\delta^3\text{T}'\$.  Formulæ for their factors .  Products of the fifth and seventh powers of the reciprocal of the distance by certain factors .  Expressions for the third derivatives of the perturbative functions with reference to the radii vectores Expressions for Y and Y'  Developments of three factors of the terms of \$\delta^2\text{T}\$  The similar factors of \$\delta^2\text{T}'\$  Portions of the secondary factors of \$\delta^3\text{T}'\$ independent of the multipliers \$nt\$ and \$n't\$  Derivation of the terms of \$\delta^3\text{T}'\$ having the arguments \$\gamma\$ and \$\gamma'\$   Portions of the secondary factors of \$\delta^3\text{T}\$ and \$\delta^3\text{T}'\$ multiplied by \$nt\$ or \$n't\$  Portions of the secondary factors of \$\delta^3\text{T}\$ and \$\delta^3\text{T}'\$ multiplied by \$n^2t^2\$ or \$n'^2t^2\$. |
| CHAPTER XVII. CALCULATION OF THE SEVERAL PORTIONS OF &T.   |
| Expressions for the fourteen parts independent of nt.  Expressions for the fourteen parts multiplied by nt.  Expressions for the fourteen parts multiplied by n <sup>2</sup> f <sup>2</sup>  |
| CHAPTER XVIII. THIRD-ORDER PERTURBATIONS OF THE MEAN ANOMALY AND RADIUS-VECTOR OF JUPITER ARISING FROM THE MUTUAL ACTION OF THIS PLANET AND SATURN.  |
| Sum of the fourteen portions of $\delta^2 T$ .  Special treatment in integration of the long-period terms  The expression for $\overline{\delta^2 W_0}$ .  Expression for the $\gamma$ derivative of the preceding.  Supplementary quantities completing the value of the differential of $n\delta^2 z$ .  Expression for the differential of $\delta^3 z$ .  Modification of the great inequality by third-order terms.  Expression for $n\delta^3 z$ .  Expression for $\delta^3 v$ .  |
| CHAPTER XIX. CALCULATION OF THE SEVERAL PORTIONS OF 6°T'.  |
| Expressions for the fourteen parts independent of $n't$ .  Expressions for the fourteen parts multiplied by $n't$ .  Expressions for the fourteen parts multiplied by $n'^2t^2$ .  |

### INTRODUCTION.

Jupiter and Saturn must have presented to the earliest observers of the celestial motions less difficulties than the interior planets. The first things noted, undoubtedly, were, that the first made a circuit of the heavens in about twelve and the second in about thirty years. Then the retrograde motion, at the time of opposition, and its extent would be perceived. The slowness and steadiness of the motion would naturally suggest the hypothesis of circular motion, but it was certainly reserved for a later and more philosophic age to explain the later-observed phenomenon by means of an epicycle.

The earliest tables of the motions of Jupiter and Saturn, as well as those of the other large planets which have come down to us, are those contained in the Syntaxis of CLAUDIUS PTOLEMY. The annual parallax is there taken into account by one epicycle and the proper eccentricity of the orbit by a second. This, in the main, is the character of all the tables of the planets until the publication of Kepler's Tabulæ Rudolphinæ in 1627, where, for the first time, the equation of the center is derived from an elliptic formula, and we pass from heliocentric to geocentric positions in the modern way. From Kepler onwards the fact of the deviation of Jupiter and Saturn from a purely elliptic theory was recognized. Many attempts were made to better the theory; but it was found that no observations, embracing a long period of time, could be satisfied by elliptic elements varying proportionally to the time. Halley seems to have been the most successful in his tables; he adopted terms in the mean longitudes varying as the square of the time.

It was not until 1748 that any computation of the perturbations of Jupiter and Saturn, in accordance with the theory of gravitation, was undertaken. This was by Euler. He appears to have limited himself to the terms which have the mean elongation of the planets from each other as their argument. Later the terms factored by the simple power of the eccentricities were added by himself, Lalande, Lagrange, Bailly, and Lambert. But these terms not bringing about a reconciliation between observation and theory, Lagrange and Laplace were led to make their notable researches on the possibility of secular equations in the mean motions of the planets. At length the whole difficulty with Jupiter and Saturn was removed by Laplace's discovery of the great inequalities in 1786.

DELAMBRE almost immediately constructed tables for these planets which far exceeded in accuracy any previously possessed. They are those which appear in the third edition of LALANDE'S Astronomie. This great success seems to have stirred up

LAPLACE and his colaborers to pushing the approximations still further. On the publication of the third volume of the Mécanique Céleste, terms of the fifth order with respect to the eccentricities and mutual inclination, as well as some of two dimensions with respect to disturbing forces, had been added to the coefficients of the great inequalities. That these advances might be utilized Bouvard constructed tables of the planets founded on observed oppositions from 1747 to 1803. The formulæ used are very nearly those given in the Mécanique Céleste, Tom. III. These tables were published by the Bureau des Longitudes in 1808. It was discovered, however, that the terms of the fifth order, mentioned above, had been taken with the wrong sign. This led Bouvard to prepare a new edition of his tables, which appeared in 1821, and in which this error was rectified, and the observations employed in the discussion extended to 1814.\* Although Bouvard himself speaks in admiration of the small residuals shown by the comparison of his theory with the observations, yet a glance shows their tendency to a systematic character, and this, too, with observations rather rudely reduced.

Plana undertook, shortly after, to compute the portions of the great inequalities which arise from considering the square of the disturbing force.† The results he obtained failed to satisfy an equation of condition which Laplace had employed in his investigation. After some discussion Laplace abandoned his equation and substituted for it another, which Plana's results were as far from satisfying as before. Pontécoulant then, taking up the subject, discovered that Laplace's results had been taken with the wrong sign, and that Plana had made errors of some importance in his investigation. When these oversights had been corrected the different results were brought into tolerable agreement.

However, the failure of Bouvard's tables to better represent observations, and his getting for the mass of Jupiter a value so much smaller than was shortly after obtained from the action of this planet on the asteroids and on its own satellites, can not be explained by this error of sign. It is somewhat singular that no one has yet pointed out the real cause, which, it seems, must be either some error in the coefficients of his formulæ or some error in putting his equations in tables.

Neither Laplace's, Plana's, nor Pontécoulant's determination of these secondorder terms can be regarded as anything else than a very rude and inadequate approximation.

Hansen had, a short time previous, imagined a new method of treating perturbations. In the *Mécanique Céleste* Laplace had determined all long-period inequalities as if they were to be applied to the mean longitude, and had so directed they should, while the short-period ones were derived as if they were to be added to the true longitude. There is, therefore, a want of congruity, and even of rigor, in this way of proceeding. For Laplace has nowhere shown how these two modes of application can be employed in unison. It is plain there would be as many methods of perturbations as there were opinions as to the dividing line separating long from short-period

<sup>\*</sup>Comparisons extending to 1819 are given in the preface to the tables; but it appears those of the last five years were added after the discussion was completed. See, on this point, LAPLACE, Théorie Analytique des Probabilités, Supplement I, p. 21.

INTRODUCTION.

inequalities. These imperfections no doubt attracted the attention of Hansen, whose thought must have been: Since it is advantageous to apply the long-period terms to the mean longitude, and indifferent whether the short-period ones are applied to the mean or true, why not apply all to the mean, and, moreover, compute the radius-vector and latitude with this equated quantity? Then the additional quantities necessary to complete the values of the latter co-ordinates would be, for the first, a function of three variations of the elements, and for the second, a function of two only. This, undoubtedly, was the origin of Hansen's new method.

He determined to apply it to Jupiter and Saturn, and his memoir, crowned by the Berlin Academy, must be regarded as the earliest example of an adequate treatment of perturbations of the second order with respect to disturbing forces. In all previous investigations it is impossible to form a conception of the probable magnitude of the terms passed over on account of the habit of the investigator of selecting here and there a term to be computed. But in Hansen the continuity in the computed terms enables one to form a fair judgment as to the importance of those neglected. However, Saturn alone is treated with a fair degree of completeness. The expressions for Jupiter are limited to the terms arising from the first power of the disturbing force. Had this theory of Saturn been completed by the addition of the terms due to the action of Uranus and the whole compared with the observations more carefully reduced, as they then could have been by the aid of Bessel's Tabulæ Regiomontanæ, very excellent tables would have been obtained. But Hansen seems to have been carried away with the ambition of applying his peculiar method of treatment to the lunar theory.

A long period of over forty years now elapsed without anything being contributed to the theories of Jupiter and Saturn, for the expressions of the perturbations given in Pontécoulant's *Théorie Analytique du Système du Monde*, beyond the correction of the error of sign in the second-order terms of the great inequalities, do not seem to be in anything more perfect than those found in the *Mécanique Céleste*.

In 1868 Mr. Hugh Breen published a memoir containing equations of condition for the whole series of observations of the two planets made at Greenwich from 1750 to 1865, and, dividing them into four groups, obtained solutions for each. But as the equations contained no terms for the corrections of the acting masses, and no investigation was made of the errors of the formulæ actually employed in the construction of Bouvard's tables, the corrections obtained, when applied to Bouvard's elements, do not give anything like a fair approximation to the actual elements.

Hansen, in 1875, published a memoir on Jupiter. But here, deserting his earlier notions on the lack of convergence in algebraical developments, he confines himself to calculating the easier terms of the co-ordinates. Hence this memoir can not be regarded as advancing much our knowledge of the subject.

In the years 1874 to 1876 appeared Leverrier's investigation, concluding with the tables which are at present employed for all the European ephemerides. The method followed is that of attributing the perturbations to the six elements of the Keplerian ellipse; and, contrary to the mode followed in his earlier planetary theories, these are also the quantities tabulated. Leverrier's labor is very much increased by his undertaking to exhibit, in the first instance, all his developments in a form where all

the elements, save the mean distances, appear as indeterminates. This he does on the plea that, however far in the future the observations may be prolonged, they ought to be represented by one and the same theory. This notion must be approved by all, but it must be pointed out that it is not completely attained by substituting, in a set of formulæ belonging to an old epoch, the values the varying elements have arrived at, at the new epoch. It is true the two sets of formulæ may be in perfect consonance, but they can not be considered as one and the same. At best, this is but a distant imitation of the method of obtaining integrals by mechanical quadratures. If we wish to have theories good for all time we shall find ourselves driven to making the coefficients of our periodic terms perfectly constant, and to admitting about three elementary constituents into the arguments for every planet that acts. Leverrier's hope that his work would serve as a foundation for future investigations is not warranted by past experience. For if at any time it is found not adequate to present wants the suspicion is sure to arise that this is due, in part at least, to not carefully enough performed calculations. Besides, we can not expect that work of this difficult nature will ever be undertaken except by well-trained experts, who will feel that they ought to be permitted to choose methods satisfactory to themselves. Thus every investigator of the planetary theories sets out ab origine.

In consequence of this adoption of indeterminate elements in the formulæ Lever-RIER'S values of the coefficients are less precise than if the latter had been treated as wholes. In the case of Saturn, however, he made an additional development by mechanical quadratures. There is not a very close agreement between the results of this and the algebraically derived formulæ. The difference, for instance, in the case of the coefficient of the great inequality exceeds 40". With the exception of the terms constituting the great inequality and a term denoting a secular acceleration of the mean longitude Leverrier employed, in the construction of his tables, formulæ resulting from this process of mechanical quadratures. The way in which the observations of Saturn were represented by this theory was not satisfactory, the residuals being larger at times than could be accepted as errors of the observers; and the comparisons made with observation since the publication of the tables have shown residuals somewhat larger. With Jupiter Leverrier was more successful, but his discussion led him to assign to Saturn a mass which astronomers at present regard as too small. However, I have not been able to discover any oversight in Leverrier's theories which would account for these discrepancies. A few trifling errors, having plainly no effect on the representation of observation, were all that were found.

The desirableness of a new investigation of the subject has been generally admitted, and fault has been found with the amount of labor required to deduce positions of the planets from Leverrier's tables. But I had not these inducements to take up the subject when I began work, for these tables were then unpublished. The long interval which occurred between the publication of Leverrier's theory of Mars and the appearance of anything from him on Jupiter and Saturn was the occasion of leading me to consider the undertaking. On making known to the Superintendent of the American Ephemeris my desire to take up the problem I was relieved from all other routine work, and supplied with the assistance necessary to duplicate all my

INTRODUCTION. 15

computations which required this safeguard against error. It was desired to abandon the use of the antiquated tables of Bouvard, and it appeared uncertain when Lever-RIER would publish his.

The plan, therefore, was to form theories of Jupiter and Saturn which would be practically serviceable for a space of three hundred years on each side of a central epoch taken near the center of gravity of all the times of observation; theories whose errors in this interval would simply result not from neglected terms in the developments, but from the unavoidable imperfections in the values of the arbitrary constants and masses adopted from the indications of observation.

Such were the considerations which influenced the adoption of the course to be followed. As there was no desire to lose time by forming a special method of treatment for the problem in hand it was decided to employ the method of HANSEN, with such slight modifications as the exigencies of the case might suggest. On account of the presence of the great inequalities this method seemed to me to give expressions best suited to tabulation. The latest form of this method appears in Hansen's memoir entitled Auseinandersetzung, etc. The employment of the eccentric anomaly of the planet whose co-ordinates are sought as the independent variable undoubtedly augments the convergence of the series; but the adoption of this mode of proceeding would bring about the use of two independent variables, one for the co-ordinates of Jupiter, another for those of Saturn. As the developments have to be pushed to terms of three dimensions with respect to disturbing forces the heaviest part of the labor consists in forming products of periodic series, one of which belongs to Jupiter, the other to Saturn; and as integration can not be performed unless these products are transformed so as to involve but one variable we should have an endless series of transformations to make. It therefore seems a necessity to have a single independent variable for the whole work. In consequence the final form adopted for all the periodic series is in terms of the mean anomalies, so that the time is always the independent variable. Fortunately very slight and readily perceived changes only are necessary in the formulæ of the Auseinandersetzung to render them applicable to the modified mode of proceeding.

Hansen's method makes two transformations of the series representing the odd powers of the distance between the acting planets in which Besselian functions are employed as multipliers; and he has thus no less than three different forms for these series, the first being that in which the eccentric anomalies of both planets appear, the second that in which one of the eccentric anomalies is replaced by a mean anomaly, and the third in which the expression is so transformed that it may be integrated by treating the first eccentric anomaly as the independent variable. One of these transformations and forms for the series can be avoided. By making the division of the circumference with reference to the mean anomaly instead of the eccentric, and computing all the auxilliary quantities to be employed so that they correspond to the points of this division, we obtain at once, and without any need of a transformation, the series in Hansen's second form. The additional labor required to make the auxilliary quantities correspond to given values of the mean anomaly instead of the eccentric is very trifling. Consequently I have adopted this way of proceeding.

On arriving at the treatment of terms of the second and third orders with respect to disturbing forces, another, and as it seems to me quite advantageous, modification was made in Hansen's method, by which the more important terms of the third order were included in the computation of those of the second order; and again, on making the computation of the third-order terms the more important terms of the fourth order were included. Past experience has shown that in the second-order terms, and presumably in all higher orders, the secular terms of lower orders cause larger modifications than the periodic terms. Thus the great inequalities, in their modification by the consideration of second-order terms, are affected about six times more by the secular than the periodic terms. Again, it is known that the second-order terms contribute very important portions to the secular terms. Hence, if on commencing the calculation of the second-order terms one could attribute to the secular terms, not their firstorder values, but these augmented by an approximate estimate of the corrections which in the obvious course of proceeding would be found for them, it is evident that the third-order terms, to be computed afterwards, would be much reduced in magnitude And in computing the third-order terms a like method of treatment could be used with like benefit, and thus the fourth-order terms be rendered more easily negligible. way of proceeding, of course, requires that the computation of every succeeding order of terms should be modified: but this is not difficult.

Thus the method I have followed is this: On arriving at the treatment of second-order terms ascertain first the two terms of  $\delta T$ , which are rigorously proportional to  $\sin \gamma$  and  $\cos \gamma$ , and apply the corresponding secular terms to the secular terms of the first order, and with these terms so corrected proceed to the general determination of  $\delta T$ ; and in third-order terms proceed in like manner. The terms of  $\delta T$  having the argument  $\gamma$  constitute a very fair approximation to the second-order portion of the secular terms, as the supplementary quantities added after the integration of T contribute in comparison quite insignificant corrections.

For the sake of brevity in the tables I have ventured, at the end, to make an alteration in the signification of the fundamental argument. In the Auseinandersetzung Hansen defines this so that, on entering a table, constructed from a purely elliptic theory, we obtain the exact angle described by the radius-vector between any given times. To flatten this out into a plane he is obliged to compute the expression of a fourth co-ordinate,  $\Gamma$ . Hansen's only apparent reason for adopting such a signification for his z is that the differential equation determining it is thereby slightly simplified. But astronomers care nothing for the description of angle by the radius; all they wish to know is whereabouts is the planet. In the Tables du Soleil Hansen has modified his z in such a way that it gives directly, by the employment of a purely elliptic table, the apparent tropical longitude of the Sun. But by making his z thus include the effect of precession he was led into a difficulty. By stopping with terms multiplied by the square of the time his tables, at remote epochs, failed to give sufficiently approximate longitudes of the Sun. Hence he published a supplement containing the terms involving the next two higher powers of the time. Should we adopt a similar mode of treating Jupiter and Saturn our difficulties would be greater, as the eccentricities of these planets are three or four times greater than that of the

17

Therefore I have equated z in such a way that it takes account of all the inequalities of the reduction to the ecliptic, secular and periodic, and also of all that part of precession which involves the square and higher powers of the time. This modification of z in no respect complicates its expression, which has the same form as before, only with numerical coefficients changed by amounts generally very small. In this way we escape the necessity of giving separate tables for the reduction to the ecliptic and for its periodic and secular perturbations. This method of treatment resembles that of Plana and Delaunay in the lunar theory, for they pay no attention to the orbit longitude of the Moon, but proceed immediately to the ecliptic longitude.

As the formulæ which have been given for the motion of the plane of the ecliptic and for precession appear to me to be lacking in the precision sufficient for these late times, on account of their being limited to terms involving the time and its square, I have devoted a chapter to this subject, in which the expressions are prolonged so as to include the cubes of the time. These expressions are not, however, the definitive ones to be employed in the construction of the tables. The determination of the motions of the equator and ecliptic belongs to the theory of the four inner planets, and when this theory is completed the necessary modifications in the final formulæ of the present work can readily be made.

I have everywhere employed the notation of Hansen without explanation, as it must now be very familiar to all who work in the planetary theories. Also, no demonstrations of the formulæ used are given whenever it is possible to make a reference to places where they may be found, generally the memoirs of Hansen. But in all important cases the formulæ actually used are set down in the interest of the detection of any errors; and it seems to me that it would be possible for one to repeat all the computations of this investigation without hindrance from obscurity in the explanations.

The arrangement of the work will be easily seen from a glance at the table of contents. The terms arising from the first power of the disturbing force are considered by themselves. This occupies Chapters I to VII. The second-order terms in the fundamental arguments and the radii vectores, due to the interaction of Jupiter and Saturn, follow. This investigation is comprised in Chapters VIII to XV. The similar terms of the third order are next treated, and fill up Chapters XVI to XX. The perturbations of the two planets which are of the second order and have the mass of Uranus as factor follow. They are contained in Chapters XXI to XXIII. second-order terms of the latitudes are then derived in Chapters XXIV and XXV. The motions of the ecliptic and precession are treated in Chapter XXVI. tudes and latitudes are referred to the mean equinox and ecliptic in Chapter XXVII. Corrections for the provisionally adopted elements are, in the next place, found by a comparison of the previously obtained theory with observation. This fills Chapter XXVIII. The formulæ for the perturbations are rectified on account of these corrections in Chapter XXIX. In fine, the summed expressions for the co-ordinates of Jupiter and Saturn are given in Chapter XXX.

In the long period of seven and a half years in which the computations of this investigation were carried on some modifications of the ideas entertained as to the proper values to be attributed to the planetary masses could scarcely fail to occur, and one will notice some incongruity in this respect; but the final results, given in Chapter XXX, are reduced to perfect uniformity in this respect. The values to which they correspond are those stated at the beginning of Chapter XXVI.

A careful comparison of the expressions obtained for the co-ordinates by Lever-RIER with those obtained in this investigation would undoubtedly have much interest, and might lead to the detection of the causes of disagreement. But the very great labor involved in carrying it out must be my excuse for not undertaking it. In the case of Saturn, too, whether Leverrier's elaboration by the algebraical process or that by mechanical quadratures should be taken for comparison would be an embarrassing question. The latter is very incomplete, yet Leverrier very nearly, as far as he could, used it for his tables. In the circumstances I must limit myself to pointing out, in a rude way, the more striking discrepancies. I have made a reduction of Leverrier's algebraically-determined coefficient of the great inequality of Saturn to Hansen's form of the perturbations and to Bessel's value of the mass of Jupiter, and it comes out 2944".80. The value assigned in Chapter XXX is 2907".85. LEVERBIER's is therefore the larger by 36".95. Had we taken for reduction the value given by Leverrier's other process the difference would have been smaller. The motions assigned to the eccentricity and perihelion of Saturn in Leverrier's tables are considerably greater than those given by my theory. In the case of Jupiter LEVERRIER'S values of the coefficients of the large terms are quite as large as mine, although they profess to correspond to the value  $\frac{1}{3529.6}$  of the mass of Saturn, while

mine have been computed with the mass  $\frac{1}{3501.6}$ . This, perhaps, explains why Lever-BIER's discussion led him to the too small mass of Saturn.

In performing the very large mass of computations demanded by this investigation, by direction of the Superintendent, I have been assisted by various gentlemen connected with this office; all, however, to small amounts, with the exception of Mr. W. F. McK. RITTER, who, with the greatest efficiency, has made a duplicate of about two-thirds of the computations. Without help such as he has rendered it would have been impossible for me to have brought this undertaking to a conclusion. But all the original computations have been performed by myself.

### A NEW THEORY OF JUPITER AND SATURN.

#### CHAPTER I.

MUTUAL ACTION OF JUPITER AND SATURN.—DEVELOPMENT OF THE RECIPROCAL OF THE DISTANCE BETWEEN THE PLANETS AND ITS ODD POWERS IN PERIODIC SERIES, WHEN ELLIPTIC VALUES ARE SUBSTITUTED FOR THE CO-ORDINATES.

The first step in determining the absolute perturbations of the elliptic motions arising from the mutual action of two planets is to obtain the expansion of the reciprocal of their distance and its odd powers in periodic series. The first and third powers alone are necessary in treating the perturbations due to the first power of the disturbing force; the fifth, in addition, is required when the second and the seventh when the third power of this force is taken into consideration. In this chapter we shall be engaged in developing these four powers of the reciprocal of the distance between Jupiter and Saturn, it being understood that elliptic values are attributed to the coordinates. The method pursued demands that these developments in their final form should appear as functions of the mean anomalies of the two planets, or in other words as functions of the time.

The elements adopted for the two planets are:

Elements of Jupiter and Saturn.

Epoch, 1850, Jan. o.od, Greenwich M. T.

It is scarcely necessary to go into details as to the derivation of these elements. They are supposed to be mean elements derived in such a way that the perturbations of the fundamental argument and the latitude have no terms whose period is the same as that of the mean anomaly, and the former no constant term or term proportional to the time. The elements of Saturn have been obtained from a previous investigation, and are supposed to be quite approximate. Those of Jupiter have been got by apply-

ing to Bouvard's values the corrections found by Mr. Breen.\* On account of the errors of Bouvard's formulæ for the perturbations these values will probably be found to need quite large corrections. But they are sufficiently accurate to serve our purpose, as it is proposed at the end of this investigation to ascertain rudely their errors and correct the expressions for the perturbations by the differential method where the squares and products of these errors may be neglected.

In computing the mutual perturbations of two planets we need consider only the ratio of the mean distances. This is given by the equation

$$\alpha = \frac{a}{a'} = \left[\frac{1+m}{1+m'}\right]^{\frac{1}{3}} \left(\frac{n'}{n}\right)^{\frac{2}{3}}$$

whence, on substitution of the numerical values,

$$\log \alpha = 9.7367410563$$

But a considerable portion of the perturbations of the second order will be included in the computation of the terms of the first order if we apply severally to  $\log a$  and  $\log a'$  the constant parts of the perturbations of  $\log r$  and  $\log r'$ . For the action of all the planets excepting Jupiter and Saturn these parts can be, with sufficient accuracy, obtained from the following formulæ:

For the action of an outer on an inner planet

$$\delta \log a = -\frac{1}{6} \operatorname{M} m' \alpha^{i} \frac{db_{i}^{(0)}}{d\alpha}$$

for the action of an inner on an outer planet

$$\delta \log a' = \frac{1}{6} Mm' \left( b_{\frac{1}{2}}^{(0)} + \alpha \frac{db_{\frac{1}{2}}^{(0)}}{d\alpha} \right)$$

where M is the modulus of common logarithms. For the action of Jupiter and Saturn the values are obtained from Hansen.

|           |                 |         | δ log a    | $\delta \log a'$ |

<sup>\*</sup> Correction of Bouvard's Elements of Jupiter and Saturn. Appendix I to Greenwich Observations, 1868.

<sup>†</sup> Untersuchung über die gegenseitigen Störungen des Jupiter und Saturn. Berlin, 1831.

To avoid confusion we will designate a and a', after their correction by these quantities, as a and a', but  $\alpha$  will be employed as the equivalent of  $\frac{a}{a'}$ . When we come to the treatment of the perturbations of the second order it will be necessary to remember that this modification has been made.

The quantities which define the relative position of the planes of the orbits can be obtained from the equations

Here J denotes the inclination of the planes of the orbits, and  $\Pi$  and  $\Pi'$ , severally, the angular distances of the perihelia of Jupiter and Saturn from the ascending node of Saturn's orbit on that of Jupiter.

The coefficients of the terms of the developments of the reciprocal of the distance between the planets  $\frac{\mathbf{a}'}{\triangle}$  and its odd powers  $\left(\frac{\mathbf{a}'}{\triangle}\right)^3$ ,  $\left(\frac{\mathbf{a}'}{\triangle}\right)^5$ , etc., as periodic functions of the two anomalies, are then functions of the following six elements:

We must now consider the degree of accuracy with which these coefficients must be computed in order that a proposed degree of accuracy may be obtained in the coefficients of the perturbations. Let it be demanded that the latter shall be got correct to o".oo1 in the longitude and latitude. The coefficients of the terms in  $\frac{a'}{\triangle}$ , whose argument is 5g'-2g, will be multiplied by the factor

15 
$$\frac{m}{1+m'} \frac{n'^2}{(5n'-2n-82'')^2} \times 206264''.8$$
, (log = 6.4738)

in order to obtain the coefficients of the perturbation of the mean anomaly of Saturn. It is thus seen that o''.oo1 in the latter is equivalent to 0.0000000034 in the former. Consequently ten-place logarithms will have to be used until we get the coefficients of the terms in  $\frac{a'}{\triangle}$ , which have the argument 5g'-2g. Recourse has been had to Vega's Thesaurus Logarithmorum for the logarithms.

In the case of  $\left(\frac{\mathbf{a}'}{\Delta}\right)^3$  a far less degree of accuracy will suffice; nevertheless, for those terms on which depend the secular perturbations a degree of accuracy has been adopted which is equivalent to the employment of eight-place logarithms. For  $\left(\frac{\mathbf{a}'}{\Delta}\right)^5$  and  $\left(\frac{\mathbf{a}'}{\Delta}\right)^7$ , respectively, seven and five-place logarithms suffice.

In developing these quantities after the manner of Hansen,\* it is preferable to take Saturn as the disturbed planet, for the reason that in this way the quantity he has denoted by  $\gamma_2$  is less than one-fifteenth of what it is when Jupiter is so taken.

We have the well-known equations

$$H = \cos (f + \Pi) \cos (f' + \Pi') + \cos J \sin (f + \Pi) \sin (f' + \Pi')$$

$$\triangle^2 = r'^2 - 2rr' H + r^2$$

If the constants k, K,  $k_1$ ,  $K_1$  are obtained from the equations

$$k \cos (\Pi' - K) = \cos \Pi$$
  $k_1 \cos (\Pi' - K_1) = \cos \mathbf{J} \cos \Pi$   $k \sin (\Pi' - K) = \cos \mathbf{J} \sin \Pi$   $k_1 \sin (\Pi' - K_1) = \sin \Pi$ 

we have

$$H = k \cos (f' + K) \cos f + k_1 \sin (f' + K_1) \sin f$$

The numerical substitutions give

$$\log k = 9.9999134935$$
  $K = 78 \text{ 10 } 31.71660$   $\log k_1 = 9.9999821696$   $K_1 = 78 \quad 9 \quad 54.40637$ 

The square of the distance between the planets is reduced to the form

$$\left(\frac{\triangle}{\mathbf{a}'}\right)^2 = \gamma_0 - f \cos\left(\varepsilon - \mathbf{F}\right) + \gamma_2 \cos^2 \varepsilon$$

by computing p, P, v, V, w, W,  $w_1$ ,  $W_1$  from the equations ( $\varphi$  and  $\varphi'$  denoting the angles of the eccentricities)

$$p \sin P = 2\alpha \left(\alpha \frac{e}{e'} - k \cos K\right)$$

$$p \cos P = 2\alpha k_1 \cos \varphi \sin K_1$$

$$v \sin \nabla = 2\alpha k \cos \varphi' \sin K$$

$$v \cos \nabla = 2\alpha k_1 \cos \varphi \cos \varphi' \cos K_1$$

$$w \sin W = p - 2\alpha^2 \frac{e}{e'} \sin P$$

$$w \cos W = v \cos (\nabla - P)$$

$$w_1 \sin W_1 = v \sin (\nabla - P)$$

$$w_1 \cos W_1 = 2\alpha^2 \frac{e}{e'} \cos P$$

$$R = 1 + \alpha^2 - 2\alpha^2 e^2$$

$$y_2 = \alpha^2 e^2$$

After which

$$f \sin (\mathbf{F} - \mathbf{P}) = w \sin (\varepsilon' + \mathbf{W}) - e'p$$

$$f \cos (\mathbf{F} - \mathbf{P}) = w_1 \cos (\varepsilon' + \mathbf{W}_1)$$

$$\gamma_0 = \mathbf{R} - 2e' \cos \varepsilon' + e'^2 \cos^2 \varepsilon' + ef \cos \mathbf{F}$$

The numerical substitutions give

<sup>\*</sup>Auseinandersetzung einer zweckmässigen Methode zur Berechnung der absoluten Störungen der kleinen Planeten. Abhandlung I, s. 138.

In the last equation the brackets denote that the common logarithms are given instead of the numbers corresponding.

It will suffice to divide the circumference with respect to the mean anomaly of Saturn (for the reasons stated in the Introduction we adopt the mean anomaly instead of the eccentric, which Hansen uses) into sixteen parts. In this way the errors committed in the coefficients belonging to the great inequality are of the 16-3 = thirteenth order with respect to the eccentricities and inclination of the orbits. The errors relative to double the argument of this inequality are of the 16-6 = tenth order. This is certainly a sufficient degree of exactitude.

We compute by trial from the equation

$$g' = \varepsilon' - e' \sin \varepsilon'$$

where  $\log (e')$  in seconds of arc) = 4.0630540554, the values of  $\epsilon'$  corresponding to the seven following values of g':

The values for the remaining points of division of the circumference are either known or readily deducible from these. By substituting them in the preceding equations which give the values of  $\gamma_0$ , f, and F, we get the following table:

| g'      | γο            | $\log f$      | $\mathbf{F}-g'$ |            |            |

These quantities can be subjected to the following important test: The sum of the values which correspond to 0°, 45°, 90°... 315° ought to be nearly equal to the sum of the values which correspond to 22°.5, 67°.5, 112°.5... 337°.5. It is known that the difference is of the eighth order with respect to the eccentricities and mutual inclination. Calling these sums S and S' the result here is:

|    | γ,0            | $\log f$      | F-  | -g' |           |
|----|----------------|---------------|-----|-----|-----------|
| S  | 10. 4083551030 | o. 3004113404 | 625 |     | 36. 50129 |
| S' | 10. 4083551013 | o. 3004113872 | 625 |     | 36. 47808 |

This test is applicable to many of the following computations, and the result of its application will always be given.

Following Hansen's procedure, we separate the square of the distance into two factors, such that

$$\left(\frac{\triangle}{\mathbf{a}'}\right)^2 = \left[\mathbf{C} - q\cos\left(\varepsilon - \mathbf{Q}\right)\right] \left[\mathbf{I} - \frac{\gamma_2}{q}\cos\left(\varepsilon + \mathbf{Q}\right)\right]$$

which gives, for determining C, q, and Q, the equations

$$\begin{aligned} \mathbf{C} &= \gamma_0 + \gamma_2 \sin^2 \mathbf{Q} \\ f \sin \mathbf{F} &= \left( q - \frac{\gamma_2 \mathbf{C}}{q} \right) \sin \mathbf{Q} \\ f \cos \mathbf{F} &= \left( q + \frac{\gamma_2 \mathbf{C}}{q} \right) \cos \mathbf{Q} \end{aligned}$$

By eliminating C and q we get

$$\sin{(Q - F)} = \frac{\gamma_2}{f^2} \frac{\gamma_0 + \gamma_2 \sin^2{Q}}{\sin{(Q + F)}} \sin^2{_2}Q$$

from which, by trial, Q may readily be obtained. In like manner q may be got from the equation

$$q = f \cos (\mathbf{Q} - \mathbf{F}) - \frac{\gamma_2 \mathbf{C}}{q} \cos 2\mathbf{Q}$$

By development from these may be obtained series, proceeding according to ascending powers of  $\gamma_2$ , which give the values of Q - F and  $\log \frac{q}{f}$ . They have been derived by Hansen.\* In our case we have preferred the method by trial. The numerical results obtained are

It seems desirable to make one more transformation in the form of  $\Delta^2$ ; we put

$$\frac{q}{\overline{C}} = \sin \chi \qquad \qquad \mathbf{a} = \tan \frac{\mathbf{i}}{2} \chi$$

$$\frac{\gamma_2}{q} = \sin \chi_1 \qquad \qquad \mathbf{b} = \tan \frac{\mathbf{i}}{2} \chi_1$$

$$\mathbf{N} = \frac{\sec \frac{\mathbf{i}}{2} \chi \sec \frac{\mathbf{i}}{2} \chi_1}{\sqrt{\overline{C}}}$$

In this way

$$\frac{\mathbf{a}'}{\triangle} = \mathbf{N} \left[ \mathbf{1} - 2\mathbf{a} \cos(\epsilon - \mathbf{Q}) + \mathbf{a}^2 \right]^{-\frac{1}{2}} \left[ \mathbf{1} - 2\mathbf{b} \cos(\epsilon + \mathbf{Q}) + \mathbf{b}^2 \right]^{-\frac{1}{2}}$$

The next step is the calculation of the values of Laplace's coefficients  $b_s^{(i)}$ , corresponding to each of the sixteen values of **a** just given. We proceed as follows:

Deriving  $\theta$  from the equation

$$\sin \theta = a$$

we get

$$b = \cos \theta \qquad a^0 = \tan^2 \frac{1}{2}\theta \qquad b^0 = \frac{\sqrt[3]{b}}{\cos^2 \frac{1}{2}\theta}$$

$$p = \frac{\left(\frac{1}{2}a^0\right)^2}{b^0} \qquad P = Mp^0 \qquad \log a^{00} = \log p - P \qquad \log b^{00} = -\frac{1}{2}P$$

where M is the modulus of common logarithms. Then

$$K = \sqrt{\frac{b^0 \ b^{00}}{b}} \qquad \qquad H = \frac{a^0}{2} \left[ r + \frac{a^{00}}{2 \sqrt[4]{b^{00}}} \right]$$

and

$$b_{i}^{(0)} = 2K \qquad b_{i}^{(1)} = aK (I + H) \qquad b_{i}^{(2)} = \frac{2}{3}K \left[ a^{2} (I + H) + H \right]$$

$$b_{i}^{(0)} = \frac{2K}{b^{4}} \left[ I - a^{2}H \right] \qquad b_{i}^{(2)} = b_{i}^{(0)} - 2K (I + H) \qquad b_{i}^{(1)} = \frac{\sin \chi}{4} \left( 3b_{i}^{(0)} + b_{i}^{(2)} \right)^{4}$$

On account of the importance of  $b_{i}^{(2)}$  and  $b_{i}^{(4)}$  and as a check their values have also been computed from the following series given by Leverrier (the coefficients are replaced by their logarithms):

<sup>•</sup> For the proof of these formulæ consult LEGENDRE, Traité des Fonctions Elliptiques, Tome II, pp. 6 and 548, † Annales de l'Observatoire de Paris, Mémoires, Tome II, Additions, p. 2.

The remainders of these series can be summed as geometrical progressions. In this way have been obtained the following values, corresponding to intervals of 0.005 in  $\log \alpha$ . From these, by interpolation, it is easy to get the values corresponding to the sixteen values of  $\log a$ :

| $\log \alpha$ | $\logb_{rac{1}{2}}^{(2)}$ | $\log b_{rac{1}{2}}^{(4)}$ |
|---------------|----------------------------|-----------------------------|
| 9. 710        | 9. 3493888435              | 8. 636820535                |

| 9. 745        | 9. 4306248085              | 8. 789073783                |
| 9. 750        | 9. 4424423364              | 8. 811057961                |
| 9. 755        | 9. 4543197411              | 8. 833108118                |
| 9. 760        | 9. 4662596138              | 8. 855227147                |
| 9. 765        | 9. 4782647015              | 8. 877418108                |

The remaining coefficients  $b_i^{(i)}$  can be got from the formula

$$b_{\frac{1}{2}}^{(i)} = \frac{4(i-1)}{2i-1} \frac{b_{\frac{1}{2}}^{(i-1)}}{\sin \chi} - \frac{2i-3}{2i-1} b_{\frac{1}{2}}^{(i-1)}$$

taking care, however, to use one more decimal in calculating than we wish to retain. But for large values of i it will be more convenient to compute the continued fraction

will be more convenient to compute
$$\frac{b_{\frac{1}{2}}^{(i)}}{b_{\frac{1}{2}}^{(i-1)}} = \frac{\frac{2i-1}{2i} \alpha}{1 - \frac{\alpha^2}{4i(i+1)}} \frac{\alpha^2}{1 - \frac{(2i+1)^2}{4(i+1)(i+2)} \alpha^2}$$

The remaining coefficients  $b_{\downarrow}^{(i)}$  are got from the equation

$$b_{\frac{1}{2}}^{(i)} = b_{\frac{1}{2}}^{(i-1)} - \frac{2(i-1)}{\alpha}b_{\frac{1}{2}}^{(i-1)}$$

When i is large one can readily deduce the ratio between the quantities for two successive values of i by induction from the differences of the preceding logarithms.

The values of the  $b_{\bullet}^{(i)}$  are obtained from the formulæ

$$b_{\sharp}^{(0)} + b_{\sharp}^{(1)} = \frac{b_{\sharp}^{(0)} + \frac{1}{3}b_{\sharp}^{(1)}}{(1-\alpha)^2} \qquad \qquad b_{\sharp}^{(0)} - b_{\sharp}^{(1)} = \frac{b_{\sharp}^{(0)} - \frac{1}{3}b_{\sharp}^{(1)}}{(1+\alpha)^2} \qquad \qquad b_{\sharp}^{(i)} = b_{\sharp}^{(i-3)} - \frac{2(i-1)}{3\alpha}b_{\sharp}^{(i-1)}$$

The formulæ used for obtaining the  $b_{i}^{(i)}$  are

$$b_{\frac{1}{4}}^{(0)} + b_{\frac{1}{4}}^{(1)} = \frac{b_{\frac{9}{4}}^{(0)} + \frac{3}{5}b_{\frac{9}{4}}^{(1)}}{(1-\alpha)^2} \qquad \qquad b_{\frac{1}{4}}^{(0)} - b_{\frac{7}{4}}^{(1)} = \frac{b_{\frac{9}{4}}^{(0)} - \frac{3}{5}b_{\frac{9}{4}}^{(1)}}{(1+\alpha)^2} \qquad \qquad b_{\frac{7}{4}}^{(i)} = b_{\frac{7}{4}}^{(i-2)} - \frac{2(i-1)}{5\alpha}b_{\frac{9}{4}}^{(i-1)}$$

The following table contains all of these quantities it has been deemed necessary to compute. For convenience the points of division of the circumference relative to g' are designated as (0), (1), . . . (15):

|      | $\log rac{1}{2} b_{rac{1}{2}}^{(0)}$ | $\log b_{\frac{1}{2}}^{(1)}$ | $\log b_{\frac{1}{4}}^{(2)}$ | $\log b_{\frac{1}{2}}^{(3)}$ | $\log b_{\frac{1}{2}}^{(4)}$ | $\log b_{\frac{1}{2}}^{(5)}$ | $\log b_{\frac{1}{2}}^{(6)}$ |

Putting

 $\left[\mathbf{1-2b}\cos\left(\epsilon+\mathbf{Q}\right)+\mathbf{b^2}\right]^{-\frac{n}{2}} = \frac{\mathbf{I}}{2}\mathbf{B}_{\frac{n}{2}}^{(0)} + \mathbf{B}_{\frac{n}{2}}^{(1)}\cos\left(\epsilon+\mathbf{Q}\right) + \mathbf{B}_{\frac{n}{2}}^{(2)}\cos\mathbf{2}\left(\epsilon+\mathbf{Q}\right) + \cdots$  it will suffice to compute the  $\mathbf{B}_{\frac{n}{2}}^{(1)}$  by the following formulæ:

$$\log\left(\frac{1}{2}B_{\frac{1}{2}}^{(0)}\right) = \frac{1}{4}Mb^{2} \qquad \log\left(\frac{1}{2}B_{\frac{1}{2}}^{(0)}\right) = \frac{9}{4}Mb^{2} \qquad \log\left(\frac{1}{2}B_{\frac{1}{2}}^{(0)}\right) = 0 \qquad \log\left(\frac{1}{2}B_{\frac{1}{2}}^{(0)}\right) = 0$$

$$B_{\frac{1}{2}}^{(1)} = \mathbf{b} \qquad B_{\frac{1}{2}}^{(1)} = 3\mathbf{b} \qquad B_{\frac{1}{2}}^{(1)} = 5\mathbf{b} \qquad B_{\frac{1}{2}}^{(1)} = 7\mathbf{b}$$

$$B_{\frac{1}{2}}^{(2)} = \frac{3}{8}b^{2} \qquad B_{\frac{1}{2}}^{(2)} = \frac{15}{4}b^{3}$$

Then, if we put  $\theta$  for  $Q - \varepsilon$ , and

$$c_{\frac{n}{2}}^{(i)} = \frac{1}{2} N^{n} B_{\frac{n}{2}}^{(i)} \cos 2iQ$$
  $s_{\frac{n}{2}}^{(i)} = \frac{1}{2} N^{n} B_{\frac{n}{2}}^{(i)} \sin 2iQ$ 

and, for convenience, omit everywhere the subscript  $\frac{n}{2}$  from the quantities b and c, according as 1 or 3 or 5 or 7 is substituted for n, we have the development of  $\frac{\mathbf{a}'}{\triangle}$  or  $\left(\frac{\mathbf{a}'}{\triangle}\right)^3$  or  $\left(\frac{\mathbf{a}'}{\triangle}\right)^5$  or  $\left(\frac{\mathbf{a}'}{\triangle}\right)^7$  given by the following series, the law of which is easily recognized:

If we put

$$\begin{aligned} k_{i} \cos K_{i} &= b^{(i)} c^{(0)} + \left( b^{(i-1)} + b^{(i+1)} \right) c^{(1)} + \left( b^{(i-2)} + b^{(i+3)} \right) c^{(2)} \\ k_{i} \sin K_{i} &= \left( b^{(i-1)} - b^{(i+1)} \right) s^{(1)} + \left( b^{(i-2)} - b^{(i+2)} \right) s^{(2)} \end{aligned}$$

 $k_i$  will not differ much from  $b^{(i)}$ , and  $K_i$  will be a small positive or negative angle. The terms having  $c^{(1)}$  and  $c^{(2)}$  as factors are much smaller than  $b^{(i)}c^{(0)}$ , and the union of the terms can be made with addition and subtraction logarithms: when these do not give sufficiently accurate results, as in the cases where  $\log k_i$  must have more than seven decimals, the following approximate formulæ can be used with advantage: x being very small, we have nearly

$$\log (1+x) = \frac{Mx}{\sqrt{1+x}} \qquad \log (1-x) = -\frac{Mx}{\sqrt{1-x}}$$

Our series now takes the form

$$\Sigma_i k_i \cos{(i\theta - \mathbf{K}_i)}$$

or, restoring for  $\theta$  its value  $Q - \varepsilon$ ,

$$\sum_{i} \left\{ k_i \cos \left[ i(\mathbf{Q} - g') - \mathbf{K}_i \right] \cos i(g' - \varepsilon) + k_i \sin \left[ i(\mathbf{Q} - g') - \mathbf{K}_i \right] \sin i(g' - \varepsilon) \right\}$$

Let us put

$$\mathbf{A}_{i}^{(c)} = \frac{1}{8}k_{i}\cos\left[i(\mathbf{Q} - g') - \mathbf{K}_{i}\right] \qquad \qquad \mathbf{A}_{i}^{(c)} = -\frac{1}{8}k_{i}\sin\left[i(\mathbf{Q} - g') - \mathbf{K}_{i}\right]$$

This division by 8 is made in order to save the constant division by these integers which occurs in the quadratures to follow. For this purpose log 8 has been subtracted from log N<sup>n</sup>.

The form of our series is now

$$\sum_{i} \left[ \mathbf{A}_{i}^{(c)} \cos i(g' - \varepsilon) + \mathbf{A}_{i}^{(s)} \sin i(g' - \varepsilon) \right]$$

The values of

$$\delta \log k_i = \log k_i - \log \left(b^{(i)}c^{(0)}\right)$$

and K<sub>i</sub> follow. In the case of the former the numbers given are units of the last decimal place employed; the small figure at the top of the column indicates the order.

25 AST—3

The values for the development of  $\frac{\mathbf{a}'}{\triangle}$  are:

|   | $\delta \log k_0$  | $\delta \log k_1$  | $\delta \log k_3$   | $\delta \log k_3$  | δ log  | $k_4$ $\delta$ 10  | $\log k_5$ $\delta \log k_5$   | og k <sub>6</sub>   | $\delta \log k_7$  | $\delta \log k_8$  |

The next step is to apply the process of mechanical quadratures to the preceding values. Let us denote any one of the coefficients  $A_i^{(e)}$ ,  $A_i^{(e)}$  by Y; and the sixteen special values of Y by  $Y_0$ ,  $Y_1$ ,  $Y_2$  . . . .  $Y_{15}$ . If Y is developed in a periodic series as a function of g', we have

$$Y = c_0 + c_1 \cos g' + c_2 \cos 2g' + c_3 \cos 3g' + \dots + s_1 \sin g' + s_2 \sin 2g' + s_3 \sin 3g' + \dots$$

and the following formulæ determine  $c_0$ ,  $c_1$ ,  $s_1$ , etc., from the special values of Y.\* Let

$$\begin{array}{lll} (\circ.8) = Y_0 + Y_8 & \left(\frac{\circ}{8}\right) = Y_0 - Y_8 \\ (1.9) = Y_1 + Y_9 & \left(\frac{1}{9}\right) = Y_1 - Y_9 \\ (2.10) = Y_2 + Y_{10} & \left(\frac{2}{10}\right) = Y_2 - Y_{10} \\ \vdots & \vdots & \vdots & \vdots \\ (7.15) = Y_7 + Y_{15} & \left(\frac{7}{15}\right) = Y_7 - Y_{15} \\ \hline (0.4) = (0.8) + (4.12) & \left(0.2\right) = (0.4) + (2.6) \\ (1.5) = (1.9) + (5.13) & \left(0.2\right) = (0.4) + (2.6) \\ (2.6) = (2.10) + (6.14) & \left(0.2\right) = (0.4) + (2.6) \\ (3.7) = (3.11) + (7.15) & \left(0.2\right) = (0.4) + (2.6) \\ \end{array}$$

Then,

$$8 (c_{0} + c_{8}) = (0.2)$$

$$8 (c_{0} - c_{0}) = (1.3)$$

$$4 (c_{2} + c_{6}) = (0.8) - (4.12)$$

$$4 (c_{2} - c_{6}) = \{[(1.9) - (5.13)] - [(3.11) - (7.15)]\} \cos 45^{\circ}$$

$$8c_{4} = (0.4) - (2.6)$$

$$4 (s_{2} + s_{6}) = \{[(1.9) - (5.13)] + [(3.11) - (7.15)]\} \cos 45^{\circ}$$

$$4 (s_{2} - s_{6}) = (2.10) - (6.14)$$

$$8s_{4} = (1.5) - (3.7)$$

$$4 (c_{1} + c_{7}) = \left(\frac{0}{8}\right) + \left\{\left(\frac{2}{10}\right) - \left(\frac{6}{14}\right)\right\} \cos 45^{\circ}$$

$$4 (c_{1} - c_{7}) = \left\{\left(\frac{1}{9}\right) - \left(\frac{7}{15}\right)\right\} \cos 22^{\circ} \cdot 5 + \left\{\left(\frac{3}{11}\right) - \left(\frac{5}{13}\right)\right\} \cos 67^{\circ} \cdot 5$$

$$4 (c_{3} + c_{5}) = \left(\frac{0}{8}\right) - \left\{\left(\frac{2}{10}\right) - \left(\frac{6}{14}\right)\right\} \cos 45^{\circ}$$

$$4 (s_{1} + s_{7}) = \left\{\left(\frac{1}{9}\right) + \left(\frac{7}{15}\right)\right\} \sin 22^{\circ} \cdot 5 - \left\{\left(\frac{3}{11}\right) - \left(\frac{5}{13}\right)\right\} \sin 67^{\circ} \cdot 5$$

$$4 (s_{1} + s_{7}) = \left\{\left(\frac{1}{9}\right) + \left(\frac{7}{15}\right)\right\} \cos 45^{\circ} + \left(\frac{4}{12}\right)$$

$$4 (s_{3} + s_{5}) = \left\{\left(\frac{1}{9}\right) + \left(\frac{7}{15}\right)\right\} \cos 45^{\circ} + \left(\frac{4}{12}\right)$$

$$4 (s_{3} + s_{5}) = \left\{\left(\frac{1}{9}\right) + \left(\frac{7}{15}\right)\right\} \cos 22^{\circ} \cdot 5 - \left\{\left(\frac{3}{11}\right) + \left(\frac{5}{13}\right)\right\} \cos 67^{\circ} \cdot 5$$

$$4 (s_{3} + s_{5}) = \left\{\left(\frac{1}{9}\right) + \left(\frac{7}{15}\right)\right\} \cos 22^{\circ} \cdot 5 - \left\{\left(\frac{3}{11}\right) + \left(\frac{5}{13}\right)\right\} \cos 67^{\circ} \cdot 5$$

$$4 (s_{3} + s_{5}) = \left\{\left(\frac{1}{9}\right) + \left(\frac{7}{15}\right)\right\} \cos 45^{\circ} - \left(\frac{4}{12}\right)$$

$$4 (s_{3} + s_{5}) = \left\{\left(\frac{1}{9}\right) + \left(\frac{7}{15}\right)\right\} \cos 45^{\circ} - \left(\frac{4}{12}\right)$$

<sup>&</sup>quot;Auseinandersetzung, Abh. I, ss. 160, 161.

As the values of the Y have already been divided by 8 we have no need to make this division in obtaining the values of  $c_i$  and  $s_i$ .

If we suppose that

$$\begin{aligned} \mathbf{A}_{i}^{(c)} &= \mathbf{C}_{i,0}^{c} + \mathbf{C}_{i,1}^{c} \cos g' + \mathbf{C}_{i,2}^{c} \cos 2g' + \dots \\ &+ \mathbf{C}_{i,1}^{c} \sin g' + \mathbf{C}_{i,2}^{c} \sin 2g' + \dots \\ \mathbf{A}_{i}^{(c)} &= \mathbf{S}_{i,0}^{c} + \mathbf{S}_{i,1}^{c} \cos g' + \mathbf{S}_{i,2}^{c} \cos 2g' + \dots \\ &+ \mathbf{S}_{i,1}^{c} \sin g' + \mathbf{S}_{i,2}^{c} \sin 2g' + \dots \end{aligned}$$

the terms in the developed function, which belong to each value of  $\nu$ , are\*

$$\frac{1}{2}\left(\mathbf{C}^{\epsilon}_{i,\,\nu}\pm\mathbf{S}^{\epsilon}_{i,\,\nu}\right)\cos\left[(i\mp\nu)g'-i\varepsilon\right]\mp\frac{1}{2}\left(\mathbf{C}^{\epsilon}_{i,\,\nu}\mp\mathbf{S}^{\epsilon}_{i,\,\nu}\right)\sin\left[(i\mp\nu)g'-i\varepsilon\right]$$

except for  $\nu = 0$ , when we have

$$C_{i,0}^c \cos (ig'-i\varepsilon) + S_{i,0}^{(c)} \sin (ig'-i\varepsilon)$$

It may be observed that in all the following expansions the constant terms are not doubled as is generally done.

It is supposed that it will be sufficiently accurate to stop with the terms whose argument involves the twelfth multiple of the motion of either planet; but as the coefficients below this limit will be modified through corrections arising from terms involving higher multiplies, it has been deemed advisable to prolong the series considerably beyond this limit. Thus, some coefficients are needed which are not given by the division of the circumference into sixteen parts. However, it is possible to derive these with sufficient accuracy for our purpose by induction from the rest. For, when the terms involving the argument  $(i + \nu)g' - i\varepsilon$  are put in the form

$$k \cos \left[ (i + \nu)g' - i\varepsilon + \beta \right]$$

it is found that when i is tolerably large and  $\nu$  not too large with reference to i,  $\log k$  and  $\beta$ , for the same value of  $\nu$ , will difference, and thus may be considered as continuous functions of i. These differences may be conjecturally prolonged, and values of k and  $\beta$ , for larger values of i, be obtained.

<sup>\*</sup>Auseinandersetzung, Abh. I, s. 165, gl. (136).

I give here three specimens of this method of induction, taken from the development of  $\frac{\mathbf{a}'}{\triangle}$ . All the quantities below the line have been inferred from the corresponding quantities above it:

| Arg.   | $\log k$  | β   |

All the coefficients in the following expressions, which belong to arguments having a multiple of  $\varepsilon$  higher than the twelfth, have been derived in this way.

These series are the developments of the first four odd powers of the reciprocal of the distance between the planets in terms of the mean anomaly of Saturn and the eccentric anomaly of Jupiter, having the general form, which may be denoted thus:

 $\sum_{i',i} [C_{i',i} \cos(i'g' + i\varepsilon) + S_{i',i} \sin(i'g' + i\varepsilon)]$

In order to be serviceable in the method of treating the problem we intend to follow it is necessary to transform the preceding series into others, the arguments of whose terms are of the general form i'g' + ig. This is done by means of the Besselian functions  $J_i^{(k)}$  (we use Hansen's notation for these quantities). The following formulæ serve for their computation:\*

Derive  $p_k$  from

$$\frac{\mathbf{r}}{\bar{p}_{k}} = r_{k} - p_{k+1}$$

<sup>\*</sup>Auseinandersetzung, Abh. I, s. 173.

where

$$r_k = \frac{k}{l}$$

in which equations we must begin with so large an integer for k that, for the first application, we can put  $p_{k+1} \equiv 0$ . This integer, in the present case, may be assumed as about 8 or 9. The value of  $J_l^{(k)}$  is then

$$J_{i}^{(h)} = J_{i}^{(0)} p_{i} p_{j} p_{j} \dots p_{h}$$

where

$$J_{1}^{(0)} = I - \frac{l^{6}}{I^{2}} + \frac{l^{4}}{I^{2} \cdot 2^{2}} - \frac{l^{6}}{I^{2} \cdot 2^{2} \cdot 3^{2}} + \dots$$

For the present purpose it suffices to suppose in these formulæ l equal in succession to  $\frac{e}{2}$ , e,  $\frac{3}{2}e$ , 2e, etc.; but as we shall hereafter need these functions corresponding to the eccentricity e' of Saturn, the following tables contain the latter quantities also:

| i  | $\log \left(J_{\frac{ie}{2}}^{(0)}-1\right)$ | $\log\frac{1}{i}J_{\frac{t_0}{2}}^{(1)}$ | $\log \frac{1}{i} J_{\frac{i\sigma}{2}}^{(2)}$ | $\log \frac{1}{i} J_{\frac{i_0}{2}}^{(3)}$ | $\log \frac{1}{i} J_{\frac{\ell_0}{2}}^{(4)}$ | $\log \frac{1}{i} J_{\frac{\omega}{i}}^{(5)}$ |

The transformation we seek to accomplish is arrived at by the aid of the equations

$$\cos\left(\beta - k\varepsilon\right) = \sum_{i=-\infty}^{i=+\infty} \frac{k}{i} J_{\frac{i\epsilon}{2}}^{(i-k)} \cos\left(\beta - ig\right)$$

$$\sin (\beta - k\varepsilon) = \sum_{i=-\infty}^{i=+\infty} \frac{k}{i} J_{\frac{ic}{2}}^{(i-k)} \sin (\beta - ig)$$

where  $\beta$  denotes any arbitrary angle. In employing these equations it must be remembered that

$$\mathbf{J}_{i}^{(-h)} = (-1)^{h} \mathbf{J}_{i}^{(h)}$$

$$\mathbf{J}_{-1}^{(h)} = (-1)^{h} \mathbf{J}_{1}^{(h)}$$

$$\mathbf{J}_{-1}^{(-k)} = \mathbf{J}_{1}^{(k)}$$

and when  $i \equiv 0$  and  $k \equiv 1$  or -1 we must suppose that the multiplier

$$\frac{k}{i}\,\mathbf{J}_{\frac{to}{2}}^{(i-k)}=-\,\frac{\mathbf{I}}{2}e$$

but when k has, in the same case, values different from 1 or -1 this multiplier vanishes.

The developments found for the four odd powers of the reciprocal of the distance of the planets, when the terms are made to take the form

$$C^{(c)} \cos (i'g' + ig) + C^{(s)} \sin (i'g' + ig)$$

are as follows:

| Arg.   | <u>.</u>   | <u>'</u>   | ( <u>a</u>   | ()3  | $\left(\frac{\underline{a}'}{\triangle}\right)^5$  |   |

## CHAPTER II.

PERTURBATIONS OF JUPITER AND SATURN ARISING FROM THEIR MUTUAL ACTION AND OF THE FIRST ORDER WITH RESPECT TO DISTURBING FORCES.

The next step in arriving at the proper expressions for the forces which the planets exert on each other is to multiply the function  $\left(\frac{\mathbf{a}'}{\triangle}\right)^3$  in its final form, given in the preceding chapter, severally by each of the four factors

$$\alpha^{2}\left(\frac{r}{a}\right)^{2}$$
  $\left(\frac{r'}{a'}\right)^{2}$   $\frac{r'}{a'}\sin(f'+\Pi')$   $-\frac{r}{a}\sin(f+\Pi)$ 

We have\*

$$\left(\frac{r}{a}\right)^2 = 1 + \frac{3}{2}e^3 - \frac{4}{1}J_{\frac{s}{1}}^{(1)}\cos g - \frac{4}{4}J_{\frac{s}{1}}^{(3)}\cos 2g - \frac{4}{9}J_{\frac{5}{1}}^{(3)}\cos 3g - \dots$$

with a similar equation for  $\left(\frac{r'}{a'}\right)^{s}$ .

In addition t

with a similar expression for  $\frac{r}{a} \sin (f + II)$ .

The numerical expressions for these four factors are (the logarithms of the coefficients are given)

$$\alpha^{3} \left(\frac{r}{a}\right)^{2} = \begin{bmatrix} 9.4746164 \end{bmatrix} \qquad \left(\frac{r'}{a'}\right)^{3} = \begin{bmatrix} 0.0020422 \end{bmatrix}$$

$$-2[8.1564087] \cos g \qquad -2[8.7484582] \cos g'$$

$$-2[6.2375704] \cos 2g \qquad -2[6.8947428] \cos 2g'$$

$$-2[4.6197410] \cos 3g \qquad -2[5.3420289] \cos 3g'$$

$$-2[3.1268416] \cos 4g \qquad -2[3.9142411] \cos 4g'$$

$$-2[2.5553314] \cos 5g'$$

$$\frac{r'}{a'}\sin(f' + \Pi') = + [8.6965298]$$

$$+ 2[9.6046934]\sin g' - 2[9.4702676]\cos g'$$

$$+ 2[8.0520079]\sin 2g' - 2[7.9174682]\cos 2g'$$

$$+ 2[6.6753852]\sin 3g' - 2[6.5407886]\cos 3g'$$

$$+ 2[5.3725363]\sin 4g' - 2[5.2379055]\cos 4g'$$

$$+ 2[4.1105366]\sin 5g' - 2[3.9758829]\cos 5g'$$

$$-\frac{r}{a}\sin(f + \Pi) = - [8.8188230]$$

$$+ 2[9.3147278]\sin g + 2[9.6578903]\cos g$$

$$+ 2[7.6969195]\sin 2g + 2[8.0399977]\cos 2g$$

$$+ 2[6.2551813]\sin 3g + 2[6.5982173]\cos 3g$$

$$+ 2[4.8872207]\sin 4g + 2[5.2302313]\cos 4g$$

$$+ 2[3.5601085]\sin 5g + 2[3.9931023]\cos 5g$$

## The required products are:

In order to get the developments of the disturbing forces it is necessary to have the expressions for the action of each disturbing planet on the Sun. In the case of Jupiter disturbed by Saturn this is proportional to the function a'  $\frac{r}{r'^2}$ H, and, in the case of Saturn disturbed by Jupiter, to the function a'  $\frac{r'}{r^2}$ H (the signification of H has been given, page 22). To obtain the periodic developments of these quantities in terms of the mean anomalies of the two planets we employ some of the auxiliary constants of page 22, as well as the Besselian functions. We compute\*

$$\begin{split} h &= \alpha k \, \cos \, \mathbb{K} & l &= \frac{1}{2} p \, \cos \, \mathbb{P} \\ h_1 &= \frac{1}{2} v \, \cos \, \mathbb{V} & l_1 &= \frac{1}{2} v \, \sin \, \mathbb{V} \\ P_i &= \frac{1}{i} \left[ J_{\frac{ia}{2}}^{(i-1)} - J_{\frac{ia}{2}}^{(i+1)} \right] & Q_i &= \frac{1}{i} \left[ J_{\frac{ia}{2}}^{(i-1)} + J_{\frac{ia}{2}}^{(i+1)} \right] \\ P_i' &= \frac{1}{i} \left[ J_{\frac{ia'}{2}}^{(i-1)} - J_{\frac{ia'}{2}}^{(i+1)} \right] & Q_i' &= \frac{1}{i} \left[ J_{\frac{ia'}{2}}^{(i-1)} + J_{\frac{ia'}{2}}^{(i+1)} \right] \end{split}$$

notice being taken that

$$P_0 = -3e$$
  $Q_0 = 0$   $P_0' = -3e'$   $Q_0' = -3e'$ 

Then

$$\begin{aligned} \mathbf{a}' \frac{r}{r'^{2}} \mathbf{H} &= \frac{1}{2} i'^{2} \left[ h \mathbf{P}_{i} \mathbf{P}_{i'} \pm h_{1} \mathbf{Q}_{i} \mathbf{Q}_{i'} \right] \cos \left( \pm i' g' - i g \right) - \frac{1}{2} i'^{2} \left[ l \mathbf{Q}_{i} \mathbf{P}_{i'} \pm l_{1} \mathbf{P}_{i} \mathbf{Q}_{i'} \right] \sin \left( \pm i' g' - i g \right) \\ \mathbf{a}' \frac{r'}{r^{2}} \mathbf{H} &= \frac{1}{2} \frac{i^{2}}{\alpha^{3}} \left[ h \mathbf{P}_{i} \mathbf{P}_{i'} \pm h_{1} \mathbf{Q}_{i} \mathbf{Q}_{i'} \right] \cos \left( \pm i' g' - i g \right) - \frac{1}{2} \frac{i^{2}}{\alpha^{3}} \left[ l \mathbf{Q}_{i} \mathbf{P}_{i'} \pm l_{1} \mathbf{P}_{i} \mathbf{Q}_{i'} \right] \sin \left( \pm i' g' - i g \right) \end{aligned}$$

in which one attributes all positive integral values to i and i', and takes the double sign in both significations.

On account of the action of the disturbing planets on the Sun it is necessary to include in the disturbing forces perpendicular to the planes of the orbits, respectively in the motions of Jupiter and Saturn, terms which are proportional to

$$-\left(\frac{\mathbf{a}'}{r'}\right)^2 \sin\left(f' + \Pi'\right)$$
 and  $\frac{\mathbf{I}}{\alpha^3} \left(\frac{\mathbf{a}}{r}\right)^2 \sin\left(f + \Pi\right)$ 

We have\*

with a similar formula for  $\left(\frac{a'}{r'}\right)^2 \sin\left(f' + \Pi'\right)$ . The numerical values being substituted, we get:

| Arg.                         | $-\left(\frac{\mathbf{a}'}{r'}\right)^2\sin $                                    | $(f' + \Pi')$  | Arg.                                     | $\frac{1}{\alpha^3} \left(\frac{a}{r}\right)^2 \sin\left(f + \Pi\right)$         |  |  |

<sup>\*</sup>Auseinandersetzung, Abh. I, s. 178.

Certain factors dependent upon the masses are here necessary. We put

$$\mu = \frac{m'}{1 + m} \alpha \frac{a}{a} \qquad \qquad \mu' = \frac{m}{1 + m'} \frac{a'}{a'}$$

These factors being expressed in seconds of arc by multiplying by the radius in seconds, we have for Jupiter

 $\log \mu = 1.5063000$ 

 $\log (\mu \alpha \sin J) = 9.5836560$ 

and for Saturn

$$\log \mu' = 2.2938045$$

$$\log (\mu'\alpha \sin J) = 0.3711605$$

For Jupiter, then, we compute the three functions

$$\begin{split} a\Omega &= \mu \left[ \frac{\mathbf{a}'}{\triangle} - \mathbf{a}' \frac{r}{r'^2} \mathbf{H} \right] \\ ar \frac{d\Omega}{dr} &= \mu \left[ -\frac{\mathbf{I}}{2} \left( \frac{\mathbf{a}'}{\triangle} \right)^3 \left( \alpha^2 \frac{r^2}{\mathbf{a}^2} - \frac{r'^2}{\mathbf{a}'^2} \right) - \frac{\mathbf{I}}{2} \frac{\mathbf{a}'}{\triangle} - \mathbf{a}' \frac{r}{r'^2} \mathbf{H} \right] \\ a^2 \frac{d\Omega}{dZ} &= \mu \alpha \sin \mathbf{J} \left[ \left( \frac{\mathbf{a}'}{\triangle} \right)^3 \frac{r'}{\mathbf{a}'} \sin \left( f' + \Pi' \right) - \left( \frac{\mathbf{a}'}{r'} \right)^2 \sin \left( f' + \Pi' \right) \right] \end{split}$$

and for Saturn the three functions

$$\begin{aligned} a'\Omega' &= \mu' \left[ \frac{\mathbf{a}'}{\triangle} - \mathbf{a}' \frac{\mathbf{r}'}{\mathbf{r}^2} \mathbf{H} \right] \\ a'r' \frac{d\Omega'}{dr'} &= \mu' \left[ \frac{\mathbf{I}}{2} \left( \frac{\mathbf{a}'}{\triangle} \right)^3 \left( \alpha^2 \frac{\mathbf{r}^2}{\mathbf{a}^2} - \frac{\mathbf{r}'^2}{\mathbf{a}'^2} \right) - \frac{\mathbf{I}}{2} \frac{\mathbf{a}'}{\triangle} - \mathbf{a}' \frac{\mathbf{r}'}{\mathbf{r}^2} \mathbf{H} \right] \\ a'^2 \frac{d\Omega'}{dZ'} &= \mu' \alpha \sin \mathbf{J} \left[ - \left( \frac{\mathbf{a}'}{\triangle} \right)^3 \frac{\mathbf{r}}{\mathbf{a}} \sin \left( f + \Pi \right) + \frac{\mathbf{I}}{\alpha^3} \left( \frac{\mathbf{a}}{\mathbf{r}} \right)^2 \sin \left( f + \Pi \right) \right] \end{aligned}$$

The quantities  $a\Omega$  and  $a'\Omega'$  are, moreover, differentiated severally with respect to g and g'. For Jupiter the three functions are:

| Arg.  | $arac{d\Omega}{dg}$ |                   | ar d            | $rac{\Omega}{dr}$ | $a^{2}rac{d\Omega}{d\mathbf{Z}}$ |             |  |

Following Hansen's method of integration we now introduce a set of symbols,  $\tau$ ,  $\gamma$ ,  $\rho$ , and  $\varphi$ , which are, respectively, the equivalents of t, g, r, and f, except that they are regarded as constant whenever we integrate. When the integration is accomplished the original symbols are restored. The next step in deriving the perturbations is to obtain the development for Jupiter of the functions \*

$$T = \frac{1}{n} \frac{dW}{dt} = Aa \frac{d\Omega}{dg} + Bar \frac{d\Omega}{dr} \qquad \qquad \frac{1}{n} \frac{dR}{dt} = Ca^2 \frac{d\Omega}{dZ}$$

and for Saturn the similar functions

$$T' = \frac{1}{n'} \frac{dW'}{dt} = A'a' \frac{d\Omega'}{dg'} + B'a'r' \frac{d\Omega'}{dr'} \qquad \qquad \frac{1}{n'} \frac{dR'}{dt} = C'a'' \frac{d\Omega'}{dZ'}$$

<sup>\*</sup>Gegenseitige Störungen des Jupiter und Saturn, s. 9, and Störungen der grossen Planeten, insbesondere des Jupiter, ss. 37, 50.

The expressions for A, B, and C are

$$\begin{split} \mathbf{A} &= -3 + \frac{1}{1 - e^2} \left\{ \left( 2\frac{\rho}{\mathbf{a}} \cos \varphi + 3e \right) \frac{\mathbf{a}^2 (\mathbf{1} - e^2) - r^2}{\mathbf{a}^2 e} + 2 \frac{\rho \sin \varphi}{\mathbf{a} \sqrt{1 - e^2}} \int \left( 2\frac{r}{\mathbf{a}} \cos f + 3e \right) dg \right\} \\ \mathbf{B} &= \frac{1}{1 - e^2} \left\{ \left( 2\frac{\rho}{\mathbf{a}} \cos \varphi + 3e \right) \frac{r \sin f}{\mathbf{a} \sqrt{1 - e^2}} - 2 \frac{\rho \sin \varphi}{\mathbf{a} \sqrt{1 - e^2}} \left( \frac{r}{\mathbf{a}} \cos f + 2e \right) \right\} \\ \mathbf{C} &= \frac{1}{\sqrt{1 - e^2}} \frac{r}{\mathbf{a}} \frac{\rho}{\mathbf{a}} \sin (\varphi - f) \end{split}$$

The expressions for A', B', and C' are obtained by accenting all the symbols contained in these equations.

In developing T and  $\frac{1}{n} \frac{dR}{dt}$  in a series of periodic terms whose arguments are composed of integral multiples of  $\gamma$ , g', and g we need compute directly only the terms which involve  $\pm \gamma$ , and in the case of the first function those which are independent of  $\gamma$ . The rest are readily supplied after integration in the functions W and R. This simplification is available, not only for the first order approximation, but for all succeeding orders. In deriving the proper developments of the multipliers A, B, and C we can employ the quantities  $P_i$  and  $Q_i$  of page 63. Thus it suffices to put

$$\frac{2\rho}{a}\cos\varphi + 3e = 2P_{1}\cos\gamma + \dots \qquad 2\frac{\rho\sin\varphi}{a\sqrt{1-e^{2}}} = 2Q_{1}\sin\gamma + \dots \\
\frac{a^{2}(1-e^{2})-r^{2}}{a^{2}e} = -\frac{5}{2}e + \frac{2}{1}Q_{1}\cos g + \frac{2}{2}Q_{2}\cos 2g + \frac{2}{3}Q_{3}\cos 3g + \dots \\
\int \left(2\frac{r}{a}\cos f + 3e\right)dg = \frac{2}{1}P_{1}\sin g + \frac{2}{2}P_{2}\sin 2g + \frac{2}{3}P_{3}\sin 3g + \dots \\
\frac{r\sin f}{a\sqrt{1-e^{2}}} = Q_{1}\sin g + Q_{2}\sin 2g + Q_{3}\sin 3g + \dots \\
\frac{r}{a}\cos f + 2e = \frac{1}{2}e + P_{1}\cos g + P_{2}\cos 2g + P_{3}\cos 3g + \dots$$

The portion of C which involves the single multiple of  $\gamma$  is

$$\mathbf{C} = \boldsymbol{\Sigma}_i \cdot \frac{\mathbf{I}}{2} (\mathbf{P}_i \mathbf{Q}_1 \pm \mathbf{P}_1 \mathbf{Q}_i) \sin (\gamma \mp ig)$$

the double sign being taken both ways.

With the understood restriction the three multipliers for Jupiter are

The corresponding quantities for Saturn are

The terms of W or R, which involve other multiples of  $\gamma$  than  $\pm 1$ , are obtained in the following way:\*

Let

W or 
$$R = \sum \alpha^{(i)} \frac{\sin}{\cos} \left( i\gamma + \beta t \right)$$

then

$$\boldsymbol{\alpha}^{(\pm i)} = \boldsymbol{\eta}^{(i)} \boldsymbol{\alpha}^{(\pm 1)} + \boldsymbol{\theta}^{(i)} \boldsymbol{\alpha}^{(\mp 1)}$$

where

$$\eta^{(i)} = \frac{1}{2} \frac{\mathbf{P}_i}{\mathbf{P}_1} + \frac{1}{2i} \frac{\mathbf{J}_{\frac{i}{2}}^{(i)}}{\mathbf{J}_{\frac{e}{2}}^{(1)}} \qquad \qquad \theta^{(i)} = \frac{1}{2} \frac{\mathbf{P}_i}{\mathbf{P}_1} - \frac{1}{2i} \frac{\mathbf{J}_{\frac{i}{2}}^{(i)}}{\mathbf{J}_{\frac{e}{2}}^{(1)}}$$

In the case of R we have, in addition,

$$\alpha^{(0)} = \eta^{(0)}(\alpha^{(1)} + \alpha^{(-1)})$$

where

$$\eta^{(0)} = \frac{1}{2} \frac{P_0}{P_1}$$

For Jupiter

$$\log \eta^{(0)} = 8.8599027n$$

$$\log \eta^{(2)} = 8.3821495$$

$$\log \eta^{(3)} = 6.9403902$$

$$\log \eta^{(4)} = 5.5724169$$

$$\log \eta^{(5)} = 4.2453$$

$$\log \eta^{(6)} = 2.9442$$

For Saturn

$$\log \eta^{(0)} = 8.9252322n$$

$$\log \eta^{(2)} = 8.4472576$$

$$\log \eta^{(3)} = 7.0706064$$

$$\log \eta^{(4)} = 5.7677404$$

$$\log \eta^{(5)} = 4.5057$$

$$\log \eta^{(6)} = 3.2696$$

The developments of T and  $\frac{1}{n} \frac{dR}{dt}$  follow; they have the form

$$\mathbf{A}_{\cos}^{\sin}\Big(\,\varkappa\gamma+i'g'+ig\,\Big)$$

The preceding expressions have to be integrated, consequently we give the logarithms of the factors proper to each argument:

Logarithms of the integrating factors for Jupiter.

| Arg.  | $\log\frac{n}{i'n'+in}$      | Arg.   | $\log\frac{n}{i'n'+in}$ | Arg.   | $\log\frac{n}{i'n'+in}$ | Arg.    | $\log \frac{n}{\mathbf{i}'n'+in}$ |

The functions W and R are obtained by means of the formulæ

$$W = \int T n dt$$
  $R = \int \left(\frac{1}{n} \frac{dR}{dt}\right) n dt$ 

The portions involving other multiples of  $\gamma$  than the single result from employing the system of multipliers  $\eta$  and  $\theta$ , as has been explained. In most cases the terms arising from the  $\theta$  multipliers can be neglected. As an illustration of this process, and on account of its interest, the terms which make up the great inequalities of the two planets may be given. They are as follows:

|  | V  | v          |   | w,   |   |
|--|--|------------|---|--|---|
| Arg.   | cos.   | sin.       | Arg.  | cos.   | sin.  |

W and R must be completed by the addition of functions of  $\tau$ , having the forms

$$W = k_0 + k_1 \left(\frac{\rho}{a}\cos\varphi + \frac{3}{2}e\right) + k_2 \frac{\rho}{a}\sin\varphi \qquad \qquad R = k_3 \frac{\rho}{a}\cos\varphi + k_4 \frac{\rho}{a}\sin\varphi$$

the k being constants. It is, however, more commodious to alter the signification of the k so that we may write in the case of Jupiter

$$W = k_0 + k_1 \cos \gamma + k_2 \sin \gamma + k_3 \sin \gamma + [8.3821074] k_1 \cos 2\gamma + [8.3821077] k_2 \sin 2\gamma + [6.9403270] k_1 \cos 3\gamma + [6.9404535] k_2 \sin 3\gamma + [5.5723410] k_1 \cos 4\gamma + [5.5724929] k_2 \sin 4\gamma + [4.2452120] k_1 \cos 5\gamma + [4.2453807] k_2 \sin 5\gamma$$

$$\mathbf{R} = -[8.8599027] k_3 + k_2 \cos \gamma + k_4 \sin \gamma + [8.3821074] k_3 \cos 2\gamma + [8.3821917] k_4 \sin 2\gamma + [8.3821074] k_3 \cos 2\gamma + [8.3821917] k_4 \sin 2\gamma + [8.3821074] k_5 \cos 2\gamma + [8.3821917] k_6 \sin 2\gamma + [8.3821074] k_6 \sin 2\gamma + [8.3821074] k_7 \cos 2\gamma + [8.3821917] k_8 \sin 2\gamma + [8.3821074] k_8 \sin 2\gamma + [8.$$

and in the case of Saturn

; ;

$$W' = k_0 + k_1 \cos \gamma' + k_2 \sin \gamma' + [8.4473145] k_2 \sin \gamma' + [8.4472006] k_1 \cos 2\gamma' + [8.4473145] k_2 \sin 2\gamma' + [7.0705210] k_1 \cos 3\gamma' + [7.0706918] k_2 \sin 3\gamma' + [5.7676379] k_1 \cos 4\gamma' + [5.7678429] k_2 \sin 4\gamma' + [4.5056153] k_1 \cos 5\gamma' + [4.5058431] k_2 \sin 5\gamma'$$

$$\mathbf{R}' = -[8.9252322] k_3 + k_3 \cos \gamma' + k_4 \sin \gamma' + \dots \dots \dots \dots$$

The perturbations of the fundamental argument, the residual perturbations of the natural logarithm of the radius vector, and the perturbations perpendicular to the plane of the orbit, so far as they depend on the first power of the disturbing force, are given by the formulæ

$$\frac{d\delta z}{dt} = \overline{W} \qquad \qquad \frac{1}{n}\frac{d\nu}{dt} = -\frac{1}{2}\left(\frac{d\overline{W}}{d\nu}\right) \qquad \qquad \frac{u}{\cos i} = \overline{R}$$

where the dash above the quantities denotes that  $\tau$  has been changed into t or, which is the same thing,  $\gamma$  into g.

The arbitrary constants k have been so assumed that the expressions for the perturbations may be simplified as much as possible. We take  $k_0$ , so that  $\delta z$  may contain no term proportional to t,  $k_1$ , and  $k_2$ , so that the terms having the argument g may disappear. In like manner  $k_3$  and  $k_4$  are determined so that  $\frac{u}{\cos i}$  may be free from terms having the argument g. In the case of Jupiter this has led us to put

$$k_0 = + 14''.2801$$
  $k_1 = - 1''.6777$   $k_2 = + 1''.6921$   $k_3 = + 0''.0636$   $k_4 = + 0''.1414$ 

and in the case of Saturn

$$k_0 = -517''.7721$$
  $k_1 = -14''.9831$   $k_2 = +1''.5080$   $k_3 = +0''.5042$   $k_4 = +0''.7901$ 

The expressions for  $\frac{d\delta z}{dt}$  and  $\frac{1}{n}\frac{d\nu}{dt}$  follow:

| Arg.         | do<br>d                   | Ss<br>i                             | $\frac{1}{n}$             | dv<br>dt                          |

The integration of the preceding expressions gives those for  $\delta z$  and  $\nu$ , except that we do not thus obtain the constant term of the latter quantity. This, however, is known to be

$$-\frac{1}{6}\left[k_0+\frac{3}{2}\frac{e}{P_1}k_1\right]$$

where P<sub>1</sub> has the signification attributed to it at page 63.\*

This formula gives us in the case of Jupiter as the constant term of  $\nu = 2^{\prime\prime}.3598$ , and in the case of Saturn as the constant term of  $\nu' + 86^{\prime\prime}.5056$ .

With regard to the terms of the perturbations factored by t it may be noted that if we denote the terms in  $n\delta z$ , having the argument g, by

$$k_1nt \sin q + k_2nt \cos q$$

and those in  $\frac{u}{\cos i}$  by

$$k_3nt \sin q + k_4nt \cos q$$

the complete expressions for these parts of the perturbations will be

$$n\delta z = k_{1}nt \left[ \sin g + \frac{1}{2} \frac{P_{2}}{P_{1}} \sin 2g + \frac{1}{3} \frac{P_{3}}{P_{1}} \sin 3g + \dots \right]$$

$$+ k_{2}nt \left[ \cos g + \frac{1}{2} \frac{Q_{2}}{Q_{1}} \cos 2g + \frac{1}{3} \frac{Q_{3}}{Q_{1}} \cos 3g + \dots \right]$$

$$v = \frac{1}{2}k_{1}nt \left[ \frac{1}{2} \frac{e}{P_{1}} + \cos g + \frac{P_{2}}{P_{1}} \cos 2g + \frac{P_{3}}{P_{1}} \cos 3g + \dots \right]$$

$$+ \frac{1}{2}k_{2}nt \left[ \sin g + \frac{Q_{2}}{Q_{1}} \sin 2g + \frac{Q_{3}}{Q_{1}} \sin 3g + \dots \right]$$

$$\frac{u}{\cos i} = k_{3}nt \left[ \sin g + \frac{Q_{2}}{Q_{1}} \sin 2g + \frac{Q_{3}}{Q_{1}} \sin 3g + \dots \right]$$

$$+ k_{4}nt \left[ -\frac{3}{2} \frac{e}{P_{1}} + \cos g + \frac{P_{2}}{P_{1}} \cos 2g + \frac{P_{3}}{P_{1}} \cos 3g + \dots \right]$$

The P and Q have been defined (page 63).

In the case of Jupiter these equations give

$$n\delta z = k_1 nt \sin (-g) + k_2 nt \cos (-g) + [8.0810774] k_1 nt \sin (-2g) + [8.0811617] k_2 nt \cos (-2g) + [6.4632057] k_1 nt \sin (-3g) + [6.4633322] k_2 nt \cos (-3g) + [4.9702810] k_1 nt \sin (-4g) + [4.9704329] k_2 nt \cos (-4g) + [3.5462420] k_1 nt \sin (-5g) + [3.5464107] k_2 nt \cos (-5g)$$

$$v = [8.0817514] k_1 nt + \frac{1}{2} k_1 nt \cos (-g) - \frac{1}{2} k_2 nt \sin (-g) + [8.0810774] k_1 nt \cos (-2g) - [8.0811617] k_2 nt \sin (-2g) + [6.6392970] k_1 nt \cos (-3g) - [6.6394235] k_2 nt \sin (-3g) + [5.2713110] k_1 nt \cos (-4g) - [5.2714629] k_2 nt \sin (-4g) + [3.9441820] k_1 nt \cos (-5g) - [3.9443507] k_2 nt \sin (-5g)$$

$$\frac{u}{\cos i} = -[8.8599027] k_4 nt + k_3 nt \sin (-g) + k_4 nt \cos (-g) + [8.3821917] k_3 nt \sin (-2g) + [8.3821074] k_4 nt \cos (-2g) + [6.9404535] k_3 nt \sin (-3g) + [6.9403270] k_4 nt \cos (-3g) + [5.5724929] k_3 nt \sin (-4g) + [5.5723410] k_4 nt \cos (-4g) + [4.2453807] k_3 nt \sin (-5g) + [4.2452120] k_4 nt \cos (-5g)$$

And in the case of Saturn

$$n'\delta z' = k'_1n't \sin g' + k'_2n't \cos g' + [8.1461706] k'_1n't \sin 2g' + [8.1462845] k'_2n't \cos 2g' + [6.5933997] k'_1n't \sin 3g' + [6.5935705] k'_2n't \cos 3g' + [5.1655779] k'_1n't \sin 4g' + [5.1657829] k'_2n't \cos 4g' + [3.8066453] k'_1n't \sin 5g' + [3.8068731] k'_2n't \cos 5g'$$

$$v' = -[8.1470809] k'_1n't - \frac{1}{2}k'_1n't \cos g' + \frac{1}{2}k'_2n't \sin g' - [8.1461706] k'_1n't \cos 2g' + [8.1462845] k'_2n't \sin 2g' - [6.7694910] k'_1n't \cos 3g' + [6.7696618] k'_2n't \sin 3g' - [5.4666079] k'_1n't \cos 4g' + [5.4668129] k'_2n't \sin 4g' - [4.2045853] k'_1n't \cos 5g' + [4.2048131] k'_2n't \sin 5g'$$

$$\frac{w'}{\cos i} = -[8.9252322] k'_4n't + k'_3n't \sin g' + k'_4n't \cos g' + [8.4473145] k'_3n't \sin 2g' + [8.4472006] k'_4n't \cos 2g' + [7.0706918] k'_3n't \sin 3g' + [7.0705210] k'_4n't \cos 3g' + [5.7678429] k'_3n't \sin 4g' + [5.7676379] k'_4n't \cos 4g' + [4.5058431] k'_3n't \sin 5g' + [4.5056153] k'_4n't \cos 5g'$$

The expressions for the perturbations of Jupiter and Saturn, arising from their mutual action, and of the first order with respect to disturbing forces, are as follows:

|          | $n\delta$                 | ìz                                 | ν                                   |                                   | u                                 |                                   |

## CHAPTER III.

PERTURBATIONS OF SATURN BY URANUS OF THE FIRST ORDER WITH RESPECT TO THE DISTURBING FORCE.

The method to be followed in this chapter is almost precisely identical with that of the preceding chapters. This will relieve us from the necessity of restating formulæ. The single point of difference is that here it will suffice to divide the circumference, with reference to the mean anomaly of Uranus, into twelve parts, instead of the sixteen which were employed for Saturn in Chapter I. As here the elements of Saturn take the place of those of Jupiter, and the elements of Uranus the place of those of Saturn, for convenience we will denote the former without accents and the latter with a single accent, reserving to ourselves the liberty of denoting, at the end, the mean anomaly of Uranus as g''.

The elements of Uranus adopted are as follows:\*

Epoch, 1850, Jan. o.o, Greenwich M. T.

$$L' = 28^{\circ} 25' 17.''05$$

$$\pi' = 168^{\circ} 15' 6.''7$$

$$\theta' = 73^{\circ} 14' 8.''0$$

$$i' = 0^{\circ} 46' 20.''54$$

$$e' = 0.0469236$$

$$n' = 15425.''752$$

$$m' = \frac{1}{21000}$$

$$\log a' = 1.2831044$$

These elements include the effect of the 4000 year inequality produced by Neptune. It seems better to do this than to take mean elements, for the reason that, in the latter way, it would be necessary to consider terms proportional to the product of the masses of Uranus and Neptune and involving the anomalies of all three planets. Log a' includes the constant term of the perturbations of the logarithm of the radius vector, which is +0.0001972. For a like reason, adding to  $\log a$  of Saturn +0.0001854, we have  $\log a = 0.9796819$ , which gives  $\log \alpha = 9.6965775$ .

The coefficients of the terms of the developments of the reciprocal of the distance between Saturn and Uranus  $\frac{a'}{\triangle}$  and its odd powers, as periodic functions of the two mean anomalies, are then functions of the following six elements:

$$\log \alpha = 9.6965775$$

$$0 = 0.05605688$$

$$0' = 0.0469236$$

$$0' = 0.0469236$$

$$0' = 0.0469236$$

$$0' = 0.0469236$$

$$0' = 0.0469236$$

$$0' = 0.0469236$$

$$0' = 0.0469236$$

$$0' = 0.0469236$$

$$0' = 0.0469236$$

$$0' = 0.0469236$$

<sup>\*</sup>An Investigation of the Orbit of Uranus, with General Tables of its Motion. By Prof. S. Newcomb, p. 181.

 $\Pi$  and  $\Pi'$  are measured from the ascending node of the orbit of Uranus on that of Saturn. In developing these quantities it is preferable to proceed as if Uranus were the disturbed planet, as in this way  $\gamma_2$  is smaller.

The values of the auxilliary constants, entirely similar to those of Chapter I, are

$$\log k = 9.9999098 \qquad \qquad K = 78 \qquad 8 \qquad 0.98$$

$$\log k_1 = 9.99998370 \qquad \qquad K_1 = 78 \qquad 9 \qquad 56.24$$

$$\log p = 0.0193100 \qquad \qquad P = 21 \quad 41 \quad 9.00$$

$$\log v = 9.9969581 \qquad \qquad V = 78 \quad 11 \quad 3.42$$

$$\log w = 9.9966348 \qquad \qquad W = 56 \quad 28 \quad 12.76$$

$$\log w_1 = 9.9971648 \qquad \qquad W_1 = 56 \quad 27 \quad 26.24$$

$$\log p_2 = 6.8904128 \qquad \qquad \log (e' in'') = 3.9858164$$

 $\gamma_0 = 1.2457067 - [8.9724213] \cos \epsilon' + [7.3427826] \cos^2 \epsilon' + [8.7486289] f \cos \mathbf{F}$ 

We compute the values of  $\varepsilon'$  corresponding to the five following values of g:

$$g'$$
 $30^{\circ}$ 
 $31^{\circ}$ 
 $24'$ 
 $2.''80$ 
 $60$ 
 $62$ 
 $22$ 
 $55.$ 
 $89$ 
 $90$ 
 $92$ 
 $41$ 
 $8.$ 
 $06$ 
 $120$ 
 $122$ 
 $16$ 
 $23.$ 
 $44$ 
 $150$ 
 $151$ 
 $17$ 
 $29.$ 
 $20$ 

The values for the seven remaining points of division of the circumference are either known or readily deducible from these. By substituting them in the equations which give the values of  $y_0$ , f, and F we get the following table:

| g'  | <b>y</b> 0         | log f      |            | F-9        | 7'     |
|-----|--------------------|------------|------------|------------|--------|
| U   |                    |            | 0          | ,          | "      |
| 0   | 1. 1665387         | 9. 9787586 | 76         | 28         | 56.89  |
| 30  | 1. 1496185         | 9. 9746368 | <b>7</b> 9 | 25         | 47. 29 |

The quantities  $\delta \log k_i$  and  $K_i$  were computed as in Chapter I, but we pass over them to the coefficients A.\* In the development of  $\frac{a'}{\triangle}$  the latter are:

The formulæ for mechanical quadratures, when the circumference is divided into twelve parts, are the following:\*

Let

$$(0.6) = Y_0 + Y_6$$

$$(1.7) = Y_1 + Y_7$$

$$(2.8) = Y_2 + Y_8$$

$$(5.11) = Y_5 + Y_{11}$$

$$(0.6) = Y_0 - Y_6$$

$$(\frac{1}{6}) = Y_1 - Y_7$$

$$(\frac{2}{8}) = Y_2 - Y_8$$

$$(\frac{2}{8}) = Y_2 - Y_8$$

$$(\frac{5}{11}) = Y_5 - Y_{11}$$

Then will

$$6 (c_0 + c_6) = (0.6) + (2.8) + (4.10)$$

$$6 (c_0 - c_6) = (1.7) + (3.9) + (5.11)$$

$$3 (c_2 + c_4) = (0.6) - \{(2.8) + (4.10)\} \sin 30^{\circ}$$

$$3 (c_2 - c_4) = \{(1.7) + (5.11)\} \sin 30^{\circ} - (3.9)$$

$$3 (s_2 + s_4) = \{(1.7) - (5.11)\} \cos 30^{\circ}$$

$$3 (s_2 - s_4) = \{(2.8) - (4.10)\} \cos 30^{\circ}$$

$$3 (c_1 + c_5) = (\frac{0}{6}) + \{(\frac{2}{8}) - (\frac{4}{10})\} \sin 30^{\circ}$$

$$3 (c_1 - c_5) = \{(\frac{1}{7}) - (\frac{5}{11})\} \cos 30^{\circ}$$

$$6c_3 = (\frac{0}{6}) - (\frac{2}{8}) + (\frac{4}{10})$$

$$3 (s_1 + s_5) = \{(\frac{1}{7}) + (\frac{5}{11})\} \sin 30^{\circ} + (\frac{3}{9})$$

$$3 (s_1 - s_5) = \{(\frac{2}{8}) + (\frac{4}{10})\} \cos 30^{\circ}$$

$$6s_3 = (\frac{1}{7}) - (\frac{3}{9}) + (\frac{5}{11})$$

The developments of the reciprocal of the distance between Saturn and Uranus, in terms of the eccentric anomaly of the former and the mean anomaly of the latter, having the form

•  $\Sigma$  . C  $\frac{\cos}{\sin} \left( i' g' + i \varepsilon \right)$ 

follow:

By the method previously given (p. 52), we compute the Besselian functions corresponding to various multiples of half the eccentricity of Uranus, and find

ponding to various multiples of half the eccentricity of Uranus, and find 
$$\log J_{\epsilon'}^{(0)} = 9.9997609 \qquad \log J_{\epsilon'}^{(1)} = 8.3702418 \qquad \log J_{\epsilon'}^{(2)} = 6.4396129$$
 
$$\log J_{\epsilon'}^{(0)} = 9.9990432 \qquad \log J_{\epsilon'}^{(1)} = 8.6709131 \qquad \log J_{\epsilon'}^{(2)} = 7.0414338$$
 
$$\log J_{\epsilon'}^{(3)} = 5.2357835 \qquad \log J_{\frac{3}{2}\epsilon'}^{(2)} = 7.3932179 \qquad \log J_{\frac{3}{2}\epsilon'}^{(3)} = 5.7637586$$
 
$$\log J_{\frac{3}{2}\epsilon'}^{(4)} = 4.0092888 \qquad \log J_{2\epsilon'}^{(3)} = 6.1381561 \qquad \log J_{2\epsilon'}^{(4)} = 4.5087087$$
 
$$\log J_{\frac{5}{2}\epsilon'}^{(5)} = 2.7822875 \qquad \log J_{\frac{5}{2}\epsilon'}^{(4)} = 4.8959184 \qquad \log J_{\frac{5}{2}\epsilon'}^{(5)} = 3.2664790$$
 
$$\log J_{\frac{5}{2}\epsilon'}^{(6)} = 1.5578013$$

The expressions for the three multipliers of  $\left(\frac{a'}{\triangle}\right)^s$  are

$$\frac{x^{2}\left(\frac{r}{a}\right)^{2}}{\left(\frac{r'}{a'}\right)^{2}} = \frac{\left[9.3951972\right] - 2\left[8.1416132\right] \cos g - 2\left[6.28790\right] \cos 2g - 2\left[4.7352\right] \cos 3g - 2\left[3.31\right] \cos 4g}{\left(\frac{r'}{a'}\right)^{2}} = 1 + \left[7.51887\right] - 2\left[8.6712719\right] \cos g' - 2\left[6.74040\right] \cos 2g' - 2\left[5.1105\right] \cos 3g' - 2\left[3.61\right] \cos 4g'}$$

$$\frac{r'}{a'} \sin (f' + II') = + \frac{\left[8.6687033\right]}{\left[9.5728624\right] \sin g' - 2\left[9.5198320\right] \cos g'}$$

$$- 2\left[7.94302\right] \sin 2g' - 2\left[7.88991\right] \cos 2g'}{- 2\left[6.4893\right] \sin 3g' - 2\left[6.4361\right] \cos 3g'}$$

$$- 2\left[5.1092\right] \sin 4g' - 2\left[5.0561\right] \cos 4g'}$$

The multiplication being performed, we obtain

| Arg=i'g +ig  | $\alpha^2 \frac{r^2}{a^2}$ | $\left(\frac{\mathbf{a}'}{\triangle}\right)^3$ | $\frac{r'^2}{a'^3}$ | <u>a'</u> )³        | $\left(\frac{\mathbf{a}'}{\triangle}\right)^3 \frac{\mathbf{r}'}{\mathbf{a}'} \sin \frac{\mathbf{a}'}{\mathbf{a}'}$ | (f'+11')                   |

In deriving the portion of the perturbative function, which arises from the action of Uranus on the Sun, we have

 $\log h = 9.0095743$   $\log h_1 = 9.0071829$   $\log l = 9.6864004$   $\log l_1 = 9.6866271$ And the expression of this portion is

| $\mathbf{Arg} = i'g' + ig$                                   | a' -  | <u>r</u> H   | Arg=i'g'+ig  | $-a'\frac{r}{r'^2}H$  |  |  |

For the component of this action perpendicular to the plane of Saturn's orbit, we have

$$-\left(\frac{\mathbf{a}'}{r'}\right)^{2}\sin\left(f' + \Pi'\right) = +0.747984\sin g' + 0.662006\cos g' +0.070164\sin 2g' + 0.062088\cos 2g' +0.005553\sin 3g' + 0.004913\cos 3g' +0.00041\sin 4g' + 0.00036\cos 4g' +0.00003\sin 5g' + 0.00003\cos 5g'$$

For the factors proportional to the mass of Uranus (in seconds of arc), we have  $\log \mu = 0.6884739$   $\log (\mu \alpha \sin J) = 8.9183882$ 

0, 1,0,

The expressions for the forces are

Integrating again we obtain  $n\delta z$  and  $\nu$ . The constant term of the latter quantity is obtained in the way mentioned at the end of Chapter II. As the quantities now given appertain to Saturn, we will restore to the symbols their accent, and the mean anomaly of Uranus will be denoted as g''.

### CHAPTER IV.

PERTURBATIONS OF JUPITER BY URANUS OF THE FIRST ORDER WITH RESPECT TO DISTURBING FORCES.

For a like reason as in the preceding chapter we here denote the quantities pertaining to Jupiter without accents and those pertaining to Uranus with a single accent.

The elements of the two planets being the same as those which have already been given (pages 19, 109), we have the corrected  $\log a = 0.7162333$  and corrected  $\log a' = 1.2831044$ . Whence  $\log \alpha = 9.4331289$ . The coefficients of the terms of the developments of the reciprocal of the distance between Jupiter and Uranus  $\frac{a'}{\triangle}$  and its odd powers are functions of the six following elements:

|                           | 0 / //                  |
|---------------------------|-------------------------|
| $\log \alpha = 9.4331289$ | J = 0.42  3.44          |
| e = 0.04824277            | $\Pi = 64 \ 26 \ 56.50$ |
| e' = 0.0469236            | $\Pi' = 220 46 7.70$    |

 $\Pi$  and  $\Pi'$  are measured from the ascending node of the orbit of Uranus on that of Jupiter. In developing these functions it is better to take the eccentric anomaly of Jupiter, as, in this way, the quantity  $\gamma_2$  is smaller.

The values of the auxiliary constants, entirely similar to those of Chapter I, are

|                           |            |                | 0     | 1  | "     |
|---------------------------|------------|----------------|-------|----|-------|
| $\log k$                  | =9.9999735 | $\mathbf{K}$   | = 156 | 19 | 17.20 |
| $\log k_1$                | =9.9999939 | $\mathbf{K}_1$ | =156  | 19 | 5.20  |
| $\log p$                  | =9.8345468 | $\mathbf{P}$   | = 71  | 26 | 4.40  |
| $\log v$                  | =9.7332373 | $\mathbf{V}$   | =156  | 17 | 50.42 |
| $\log w$                  | =9.7340868 | W              | = 84  | 52 | 22.26 |
| $\log w_1$                | =9.7332136 | W              | 1= 84 | 53 | 51.63 |
| $\log \frac{1}{2} \gamma$ | =5.9320922 |                |       |    |       |

On account of the smallness of  $\alpha$  and the consequent smallness of  $\frac{1}{2}\gamma_2$ , we shall not employ the transformation involving the quantities we have denoted as N, a and b, and the resulting  $\delta \log k$  and K, but proceed by the method of Hansen,\* where he puts  $D = \gamma_0 + \frac{1}{2}\gamma_2$ , and we have

$$\left(\frac{\triangle}{\mathbf{a}'}\right)^2 = \mathbf{D} - f\cos\left(\varepsilon - \mathbf{F}\right) + \frac{1}{2}\gamma_2 \cos 2\varepsilon$$

Here we have

$$D = 1.07323843 - [8.9724213] \cos \epsilon' + [7.3427826] \cos^2 \epsilon' + [8.6834322] f \cos \mathbf{F}$$

As in the preceding chapter, we divide the circumference into twelve parts, with reference to g' the mean anomaly of Uranus. The values of e', for these points, have already been given (page 110), and we obtain:

| <i>g</i> ′ | D          | $\log f$   | $\mathbf{F}-g'$ |    |                 |
|------------|------------|------------|-----------------|----|-----------------|
|            |            |            | 0               | ,  | "               |
| (0)        | 0. 9591055 | 9. 7077032 | 156             | I  | 21.54           |
| (1)        | 0. 9702936 | 9. 7104830 | 159             | 15 | 53. 22          |

| (11)       | 0. 9812273 | 9. 7128003 | 152             | 51 | 4 <b>5</b> . 93 |
| s          | 5. 4714155 | 8. 4055070 | 937             | 57 | 41.02           |
| S'         | 6. 4714154 | 8. 4055071 | 937             | 57 | 41.02           |

We propose now to develop the quantity  $[D-f\cos(\varepsilon-F)]^{-\frac{n}{2}}$ , n being a positive odd integer; afterwards passing thence to the developments of  $\frac{\mathbf{a}'}{\triangle}$ ,  $\left(\frac{\mathbf{a}'}{\triangle}\right)^3$ , etc., by multiplying by the very small factor  $\frac{1}{2}\gamma_2\cos 2\varepsilon$ , and applying the resulting corrections. With Hansen \* we put

$$[D - f \cos(\varepsilon - F)]^{-\frac{n}{2}} = a_0^{(n)} + 2a_1^{(n)} \cos(\varepsilon - F) + 2a_2^{(n)} \cos 2(\varepsilon - F) + \dots$$

By the method given by Hansen the values of  $\log \frac{1}{6} \alpha_i^{(n)}$  have been computed. The division by six is employed for the purpose of saving the constant division by this integer, which occurs in the following process of mechanical quadratures.

<sup>\*</sup> Auseinandersetzung, Abh. I, s. 150.

|      | $\log \frac{1}{6} \alpha_0^{(1)}$ | $\log \frac{1}{6} \alpha_1^{(1)}$ | $\log\frac{1}{6}\alpha_2^{(1)}$              | $\log \frac{1}{6} \alpha_3^{(1)}$ | $\log \frac{1}{6} \alpha_4^{(1)}$        | $\log\frac{1}{6}\alpha_5^{(1)}$ | $\log \frac{1}{6} \alpha_6^{(1)}$ |

The values of the coefficients A, precisely as in Chapter III, but relative to  $[D-f\cos{(\epsilon-F)}]^{-\frac{1}{2}}$ , instead of to  $\frac{\mathbf{a}'}{\triangle}$ , are:

|      | $\mathbf{A}_0^{(c)}$          | <b>A</b> <sub>1</sub> <sup>(c)</sup> | A <sub>1</sub> (*) |                               | A <sub>2</sub> <sup>(c)</sup> | $A_2^{(s)}$                   | A                             | (c)                                  | $\mathbf{A_3}^{(s)}$          |       | $\mathbf{A}_{\mathbf{d}}^{(\sigma)}$ |

From these coefficients are derived the developments of the form  $[D-f\cos(\varepsilon-F)]^{-\frac{n}{2}}$ , where n successively is 1, 3, and 5; which, as they are so nearly those of  $\frac{a'}{\triangle}$ , etc., we do not give, but pass immediately to the expressions of the latter functions. We have

We compute the following Besselian functions, corresponding to the multiples of half the eccentricity of Uranus, by means of the process given, (page 52):

|  | $l = \frac{1}{2}e'$ | l = e'    | $l=\frac{3}{2}e'$ | l=2e'     | $l=\frac{5}{2}e'$ |
|--|---------------------|-----------|-------------------|-----------|-------------------|
| $\log  \mathbf{J}_{\iota}^{\scriptscriptstyle{(0)}}$ | 9.9997610           | 9.9990432 | 9.9978458         | 9.9961666 | 9.99400           |
| $\log  { m J}_{t}^{\scriptscriptstyle (1)}$          | 8.3702419           | 8.6709131 | 8.8464064         | 8.97051   | 9.06634           |
| $\log J_i^{(i)}$                                     | 6.43961 <b>3</b> 0  | 7.0414338 | 7.3932179         | 7.64254   | 7.83564           |
| $\log \mathbf{J}_{i}^{(3)}$                          | 4.3328729           | 5.2357835 | 5.7637586         | 6.13816   | 6.42835           |
| $\log  \mathbf{J}_{\iota}^{\scriptscriptstyle{(4)}}$ | 2.1011862           | 3.3051637 | 4.0092888         | 4.50871   | 4.89592           |
| $\log \mathbf{J}_{i}^{^{(5)}}$                       |                     |           | 2.1578731         | 2.78229   | 3.26648           |

Then, for the three multipliers of  $\left(\frac{a}{\angle}\right)^{3}$ , we have:

$$\alpha^{2} \frac{r^{2}}{a^{2}} = [8.8677713] - 2[7.5495636] \cos g - 2[5.63073] \cos 2g - 2[4.0129] \cos 3g$$

$$\frac{r'^{2}}{a^{2}} = [0.0014320] - 2[8.6712719] \cos g' - 2[6.74040] \cos 2g' - 2[5.1105] \cos 3g'$$

$$\frac{\mathbf{r}'}{\mathbf{a}'}\sin(f' + \Pi') = + \begin{bmatrix} 8.6624013 \end{bmatrix} \\
-2[9.5776690] \sin g' \\
-2[7.94783] \sin 2g' \\
-2[6.4941] \sin 3g' \\
-2[5.1139] \sin 4g' + 2[6.4298] \cos 3g' \\
-2[5.0500] \cos 4g'$$

# The products are:

| Arg=i'g'+ig  | $a_{\overline{a}^2}^{r^2}$ | $\frac{\mathbf{a}'}{\triangle}$ ) <sup>3</sup> | $\frac{r'^2}{\mathbf{a}'^2} \left( \frac{\mathbf{a}}{\triangle} \right)$ | )3                 |

The expressions for the three multipliers, A, B, and C, have already been given (page 73). The resulting expressions for T and  $\frac{1}{n}\frac{d\mathbf{R}}{dt}$  follow: in the latter the terms having the argument  $\gamma$  are alone retained, as the periodic perturbations of the latitude are quite insignificant.

### CHAPTER V.

#### PERTURBATIONS OF SATURN BY NEPTUNE

In determining the action of Neptune on our two planets it will not be necessary to go beyond terms of the first order with respect to disturbing forces. Following the previous custom, no accents will be given to quantities pertaining to Saturn, and a single one to those belonging to Neptune.

The elements of Neptune employed are the following: \*

Epoch 1850, Jan. o.o, Greenwich M. T.

$$L' = 335 \quad 5 \quad 38.91$$
 $\alpha' = 43 \quad 17 \quad 30.3$ 
 $\alpha' = 7864''.935$ 
 $\alpha' = 130 \quad 7 \quad 31.83$ 
 $\alpha' = 1.4781414$ 
 $\alpha' = 1 \quad 47 \quad 1.68$ 
 $\alpha' = \frac{197}{197}$ 

These elements include the effect of the 4000-year inequality produced by the action of Uranus. Also,  $\log a'$  includes the constant term of the perturbations of the logarithm of the radius vector. As the similarly corrected  $\log a$  of Saturn is 0.9796819, we have here  $\log \alpha = 9.5015405$ .

The coefficients of the terms of the developments of the reciprocal of the distance between Saturn and Neptune and its odd powers are then functions of the following six elements:

$$\log \alpha = 9.5015405$$
  $J = 0.57 51.54$ 
 $e = 0.05605688$   $II = 192 9 3.80$ 
 $e' = 0.0084962$   $II' = 145 19 5.10$ 

 $\Pi$  and  $\Pi'$  are measured from the ascending node of the orbit of Neptune on that of Saturn. The developments will be made first in terms of the eccentric anomaly of Saturn.

<sup>\*</sup>An Investigation of the Orbit of Neptune, with General Tables of its Motion. By Prof. S. Newcomb, p. 76.

The values of the auxiliary constants are

|            |                           |                  | 0   | /  | //           |
|------------|---------------------------|------------------|-----|----|--------------|
| $\log k$   | = 9.9999973               | K =              | 313 | 10 | 7.32         |
| $\log k_1$ | = 9.9999413               | $\mathbf{K}_1 =$ | 313 | 9  | 55.30        |
| $\log p$   | = 0.0030502               | P =              | 117 | 19 | 1.88         |
| $\log v$   | = 9.8021937               | <b>V</b> =       | 313 | 7  | 5 <b>.68</b> |
| $\log w$   | = 9.8023874               | $\mathbf{W} =$   | 195 | 53 | 27.92        |
| $\log w_1$ | = 9.8019933               | $W_1 =$          | 195 | 48 | 30.74        |
| log 1 v    | <sub>3</sub> == 6.1003000 |                  |     |    |              |

 $\mathbf{D} = 1.1002373 - [8.2302547] \cos \epsilon' + [5.85845] \cos^3 \epsilon' + [8.7486289] f \cos \mathbf{F}$ 

The circumference will be divided into twelve parts with reference to the mean anomaly of Neptune. For five points of the division we nave

We get the following table of values of D,  $\log f$ , and F:

| g'  | D          | $\log f$           | F — g' |    | g'            |
|-----|------------|--------------------|--------|----|---------------|
|     |            |                    | 0      | ,  | .,            |
| o   | 1. 1080847 | 9. 8038257         | 313    | 57 | 23.41         |

The corrections to pass from the development of  $[D-f\cos{(\epsilon-F)}]^{-\frac{a}{2}}$  to that of  $\left(\frac{a'}{\triangle}\right)^a$  are so small that it is deemed unnecessary to give the expressions for the former quantities, but we pass immediately to  $\left(\frac{a'}{\triangle}\right)$  and  $\left(\frac{a'}{\triangle}\right)^3$ .

The expressions for the two factors by which  $\left(\frac{\mathbf{a}'}{\triangle}\right)^{3}$  must be multiplied are

$$\frac{1}{2} \left( \frac{r'^2}{a'^2} - \alpha^2 \frac{r^2}{a^2} \right) = {}^{\bullet} [9.6526918]$$

$$-2[7.6281908] \cos g' + 2[7.4505092] \cos (-g)$$

$$-2[4.9553] \cos 2g' + 2[5.5968] \cos (-2g)$$

$$+2[4.0441] \cos (-3g)$$

$$\frac{r'}{a'} \sin (f' + \Pi') = -[7.8604435]$$

$$-2[9.6139931] \sin g' + 2[9.4540858] \cos g'$$

$$-2[7.24218] \sin 2g' + 2[7.08227] \cos 2g'$$

$$-2[5.0465] \sin 3g' + 2[4.8866] \cos 3g'$$

# The products are

| Arg=i'g'+ig  | $\frac{1}{2}\left(\frac{r'^2}{a'^2}-a\right)$ | $\binom{2^{r^2}}{a^2}$ $\binom{a'}{\triangle}^3$ | $\frac{r'}{\mathbf{a}'}\sin\left(f'+\Pi'\right)\left(\frac{\mathbf{a}'}{\Delta}\right)^3$ |                    |  |

For the computation of  $a' \frac{r}{r'^2}H$  we have (page 63)

 $\log h = 9.3366883 \qquad \log l = 9.3637535^n$   $\log h_1 = 9.3359062 \qquad \log l_1 = 9.3644536n$ 

## We have then

| Arg=i'g'+ig                                  | —a' <u>r</u>   |  | Arg=i'g'+ig                              | $-a'\frac{r}{r'^2}H$  |   |  |

In addition

$$-\frac{a'^2}{r'^2}\sin(f'+\Pi') = +0.82229\sin g' - 0.56900\cos g'$$

$$+0.01397\sin 2g' - 0.00967\cos 2g'$$

$$+0.00020\sin 3g' - 0.00014\cos 3g'$$

The logarithms of the factors which depend on the mass of Neptune are  $\log \mu = 0.5211900$   $\log (\mu \alpha \sin J) = 8.2488067$ 

The expressions for the forces are then

| Arg=i'g'+ig | $arac{d}{c}$ | $\frac{\Omega}{lg}$ | ar                | dΩ<br>dr           | $a^2rac{d\Omega}{dZ}$ |                   |

In integrating we put

$$k_0 = + \circ''.3763$$
  $k_1 = - \circ''.0492$   $k_2 = - \circ''.0025$   $k_3 = + \circ''.0025$   $k_4 = + \circ''.0005$   
And we have

| Arg=i'g'+ig  | $\frac{d}{d}$            | δz<br>i               | $\frac{1}{n}\frac{\dot{a}}{\dot{a}}$ | $\frac{l\nu}{lt}$           |

### CHAPTER VI.

#### PERTURBATIONS OF JUPITER BY NEPTUNE.

In this case also first-order terms suffice. The elements of the two planets have already been given (pages 19, 161). The coefficients of the terms of the developments of the reciprocal of the distance between Jupiter and Neptune, and its odd powers, are functions of the six elements

|                           | 0            | /  | 111   |
|---------------------------|--------------|----|-------|
| $\log \alpha = 9.2380919$ | $J = \circ$  | 56 | 53.38 |
| e = 0.04824277            | $\Pi = 196$  | 4  | 4.53  |
| e' = 0.0084962            | $\Pi' = 227$ | 24 | 47.47 |

 $\Pi$  and  $\Pi'$  are measured from the ascending node of the orbit of Neptune on that of Jupiter. The developments will be made first in terms of the eccentric anomaly of the latter planet.

The values of the auxiliary constants are

|            |               | 0                            | 1  | //    |
|------------|---------------|------------------------------|----|-------|
| $\log k$   | = 9.9999955   | $K = 3^{T}$                  | 20 | 50.47 |
| $\log k_1$ | = 9.9999450   | $\mathbf{K}_1 = 3\mathbf{r}$ | 20 | 35.43 |
| $\log p$   | =9.2675773    | P = 13                       | 53 | 1.47  |
| $\log v$   | = 9.5387100   | V = 3I                       | 22 | 43.86 |
| $\log w$   | = 9.5385860   | W = 17                       | 26 | 35.35 |
| $\log w_1$ | = 9.5390766   | $W_1 = 17$                   | 28 | 47.54 |
| log 1 v    | 2 = 5.5420182 |                              |    |       |

$$D = 1.0298308 - [8.2302547] \cos \epsilon' + [5.8584494] \cos^2 \epsilon' + [8.6834322] f \cos F$$

The circumference will be divided into eight parts with reference to g', the mean anomaly of Neptune. For three points of division we have

We get the following table of values of D,  $\log f$ , and F:

| g'  | *D          | $\log f$   | $\mathbf{F}$ — $g'$ |    | g'     |
|-----|-------------|------------|---------------------|----|--------|
| 0   |             |            | ۰                   | ,  | 11     |
| o   | 1. 027 1856 | 9. 5383650 | 31                  | 3  | 45. 80 |
| 45  | 1.0217845   | 9. 5368144 | 31                  | 33 | 22. 27 |

The following are the formulæ for mechanical quadratures in the case of the division of the circumference into eight parts:

If

$$\begin{array}{lll} (\text{o.4}) = \text{Y}_0 + \text{Y}_4 & (\frac{\text{o}}{4}) = \text{Y}_0 - \text{Y}_4 \\ (\text{i.5}) = \text{Y}_1 + \text{Y}_5 & (\frac{1}{5}) = \text{Y}_1 - \text{Y}_5 \\ (\text{2.6}) = \text{Y}_2 + \text{Y}_6 & (\frac{\text{o}}{6}) = \text{Y}_2 - \text{Y}_6 \\ (\text{3.7}) = \text{Y}_3 + \text{Y}_7 & (\frac{\text{o}}{7}) = \text{Y}_3 - \text{Y}_7 \\ & (\text{o.2}) = (\text{o.4}) + (\text{2.6}) \\ & (\text{i.3}) = (\text{i.5}) + (\text{3.7}) \end{array}$$

Then

$$\begin{aligned} \mathbf{2}(c_0 + c_4) &= (0.2) & 2(c_1 + c_3) &= (\frac{0}{4}) \\ \mathbf{2}(c_0 - c_4) &= (1.3) & 2(c_1 - c_3) &= [(\frac{1}{5}) - (\frac{3}{7})] \cos 45^{\circ} \\ \mathbf{4} \ c_2 &= (0.4) - (2.6) & 2(s_1 + s_3) &= [(\frac{1}{5}) + (\frac{3}{7})] \cos 45^{\circ} \\ \mathbf{4} \ s_2 &= (1.5) - (3.7) & 2(s_1 - s_3) &= (\frac{2}{6}) \end{aligned}$$

The quantity  $\frac{1}{2}\gamma_2$  is so small that we may neglect the terms multiplied by it, and thus may take  $[D-f\cos{(\epsilon-F)}]^{-\frac{1}{s}}$  as the equivalent of  $\frac{a'}{\triangle}$ .

For the computation of  $a'\frac{r}{r'^2}H$  we have

$$\log h = 9.169560 P$$
$$\log h_1 = 9.1690072$$

$$\log l = 8.9536702$$

$$\log l_1 = 8.9542630$$

And the expression for  $a'\frac{r}{r'}H$  follows

| Arg=i'g'+ig                                      | a' * <sub>r'2</sub> H   |  | Arg=i'g'+ig                                | -a' "/ <sub>p''2</sub> H   |  |

### CHAPTER VII.

#### PERTURBATIONS OF JUPITER AND SATURN BY THE FOUR INTERIOR PLANETS.

Here we need take account only of the secular terms, the constant terms of  $\nu$ , and, in the action of Venus and the Earth, of the terms of  $n\delta z$  and  $\nu$ , which depend on the single multiple of the elongation of the disturbing planet from the disturbed. The terms to be derived are so few and small that they may most readily be got by an algebraical development of  $\frac{\mathbf{a}'}{\triangle}$ .

The elements of the interior planets for the epoch 1850.0 needed for the computation are

|       | Mercury.      | Venus.            | Earth.          | Mars.           |
|-------|---------------|-------------------|-----------------|-----------------|
| π     | 75° 7′ 13″.62 | 129° 27′ 42″.83   | 100° 21′ 39″.73 | 333° 17′ 51″-74 |
| i     | 7° °′ 7″.71   | 3° 23′ 35″.01     | 0 0 0           | 1° 51′ 2″.24    |
| ស     | 46° 33′ 8″.63 | 75° 19′ 53″.08    |                 | 48° 23′ 54″.59  |
| e     | 0.20560476    | 0.00684311        | 0.01677114      | 0.09326803      |
| n     | 5381016".260  | 2106641".357      | 1295977".416    | 689050".784     |
| log a | 9.5878217     | <b>9.</b> 8593378 | 0.000000        | 0.1828971       |
| m     | 1             |                   | I               | I               |
| ,,,   | 500000        | 425000            | 322800          | 3093500         |

Action of Mercury on Jupiter.

In this case

$$\log \alpha = 8.8715885 \quad \log b_{\frac{1}{2}}^{(0)} = 0.30163 \qquad \log b_{\frac{1}{2}}^{(1)} = 8.87249 \qquad \log \alpha b_{\frac{1}{2}}^{(1)} = 8.22481$$

$$\log \alpha \frac{db_{\frac{1}{2}}^{(0)}}{d\alpha} = 7.74588 \qquad \log \alpha \frac{db_{\frac{1}{2}}^{(1)}}{d\alpha} = 8.87430 \qquad \log \alpha^2 \frac{d^2b_{\frac{1}{2}}^{(0)}}{d\alpha^2} = 7.75129 \qquad \log \alpha^2 \frac{d^2b_{\frac{1}{2}}^{(1)}}{d\alpha^2} = 6.9720$$

The constant term of  $\nu$  is given by the formula

$$\nu = \frac{1}{6} \frac{m}{\mu'} \left[ b_{\frac{1}{2}}^{(0)} + \alpha \frac{db_{\frac{1}{2}}^{(0)}}{d\alpha} \right]$$

and in this case is

$$\nu = + o''.0138$$

We have also the following terms in  $\frac{a'}{\wedge}$ 

$$\frac{a'}{\Delta} = [7.32172](6^2 + 6'^2) - [7.92378]\sin^2\frac{1}{2}J - [6.59106]ee'\cos(\Pi' - \Pi)$$

In which we have

$$\log \sin \frac{1}{2} J = 8.7391$$
  $II' - II = 296^{\circ} 43'$ 

From this expression it is easy to find that the secular terms of  $n\delta z$ ,  $\nu$ , and  $\frac{u}{\cos i}$  are

$$n\delta z = -0.000059nt \sin (-g) - 0.0000137nt \cos (-g)$$

$$v = -0.0000030nt \cos (-g) + 0.000069nt \sin (-g)$$

$$\frac{u}{\cos i} = +0.000008nt \sin (-g) - 0.0000171nt \cos (-g)$$

Action of Venus on Jupiter.

In this case

$$\log \alpha = 9.1431046 \qquad \log b_{\frac{1}{2}}^{(0)} = 0.30315 \qquad \log b_{\frac{1}{2}}^{(1)} = 9.14628 \qquad \log b_{\frac{1}{2}}^{(0)} = 8.16479$$

$$\log \alpha \frac{db_{\frac{1}{2}}^{(0)}}{d\alpha} = 8.29574 \qquad \log \alpha \frac{db_{\frac{1}{2}}^{(1)}}{d\alpha} = 9.15264 \qquad \log \alpha \frac{db_{\frac{1}{2}}^{(1)}}{d\alpha} = 8.46937$$

$$\log \alpha^2 \frac{d^3b_{\frac{1}{2}}^{(0)}}{d\alpha^2} = 8.31457 \qquad \log \alpha^2 \frac{d^3b_{\frac{1}{2}}^{(1)}}{d\alpha^2} = 7.79914 \qquad \log \alpha^2 \frac{d^3b_{\frac{1}{2}}^{(2)}}{d\alpha^2} = 8.48344$$

$$\log \alpha^2 \frac{d^3b_{\frac{1}{2}}^{(0)}}{d\alpha^3} = 7.43109 \qquad \log \alpha^2 \frac{d^3b_{\frac{1}{2}}^{(1)}}{d\alpha^3} = 7.83341 \qquad \log \alpha^2 \frac{d^3b_{\frac{1}{2}}^{(2)}}{d\alpha^3} = 7.47526$$

$$\log \alpha^4 \frac{d^3b_{\frac{1}{2}}^{(0)}}{d\alpha^4} = 7.48662 \qquad \log \alpha^4 \frac{d^3b_{\frac{1}{2}}^{(1)}}{d\alpha^4} = 7.20768 \qquad \log \alpha^4 \frac{d^3b_{\frac{1}{2}}^{(2)}}{d\alpha^4} = 7.52801$$

$$\log \alpha b_{\frac{1}{2}}^{(1)} = 8.77923 \qquad \log \alpha^2 b_{\frac{1}{2}}^{(0)} = 8.63965$$

$$\log \alpha^2 \frac{db_{\frac{1}{2}}^{(0)}}{d\alpha} = 8.41003 \qquad \log \alpha^2 \frac{db_{\frac{1}{2}}^{(1)}}{d\alpha} = 8.81022 \qquad \log \alpha^2 b_{\frac{1}{2}}^{(0)} = 7.54622$$

$$\log \alpha^2 \frac{d^3b_{\frac{1}{2}}^{(0)}}{d\alpha^2} = 8.46044 \qquad \log \alpha^3 \frac{d^3b_{\frac{1}{2}}^{(1)}}{d\alpha^2} = 8.14175 \qquad \log \alpha^2 \frac{db_{\frac{1}{2}}^{(1)}}{d\alpha} = 8.38980$$

The constant term of  $\nu$  is

$$\nu = + 0''.1640$$

The non-periodic portion of  $\frac{\mathbf{a}'}{\triangle}$  contains the following terms:

$$\frac{\mathbf{a}'}{\triangle} = [7.87614] (e^2 + e'^2) - [8.47820] \sin^2 \frac{1}{2} \mathbf{J} - [7.41622] ee' \cos (\Pi' - \Pi)$$

$$+ [8.53188] \sin^4 \frac{1}{2} \mathbf{J} + [6.03454] e^4 + [8.08876] e^2 e'^2$$

$$+ [7.99054] e'^4 - [8.69081] (e^2 + e'^2) \sin^2 \frac{1}{2} \mathbf{J} - [7.32535] e^3 e' \cos (\Pi' - \Pi)$$

$$- [7.83041] ee'^3 \cos (\Pi' - \Pi) + [8.48167] ee' \sin^2 \frac{1}{2} \mathbf{J} \cos (\Pi' - \Pi) + [6.69417] e^2 e'^2 \cos 2(\Pi' - \Pi)$$

$$+ [8.89363] e^2 \sin^2 \frac{1}{2} \mathbf{J} \cos 2\Pi - [8.21647] ee' \sin^2 \frac{1}{2} \mathbf{J} \cos (\Pi' + \Pi) + [6.93763] e'^2 \sin^2 \frac{1}{2} \mathbf{J} \cos 2\Pi'$$

$$- [8.89363] e^2 \sin^2 \frac{1}{2} \mathbf{J} \cos 2\Pi - [8.21647] ee' \sin^2 \frac{1}{2} \mathbf{J} \cos (\Pi' + \Pi) + [6.93763] e'^2 \sin^2 \frac{1}{2} \mathbf{J} \cos 2\Pi'$$

In which we have

$$J = 2^{\circ} 15' 11''.34$$
  $II' = 310^{\circ} 4' 23''.11$   $II = 67^{\circ} 36' 52''.64$ 

From this expression we find

$$-\frac{1}{e'}\frac{d\left(\frac{\mathbf{a}'}{\triangle}\right)}{dII'} = +0.0000158$$

$$-\frac{d\left(\frac{\mathbf{a}'}{\triangle}\right)}{de'} = -0.0007369$$

$$\frac{d\left(\frac{\mathbf{a}'}{\triangle}\right)}{dJ} = -0.0005933$$

$$\frac{1}{\sin J}\left[\frac{d\left(\frac{\mathbf{a}'}{\triangle}\right)}{dII} + \cos J\frac{d\left(\frac{\mathbf{a}'}{\triangle}\right)}{dII'}\right] = +0.0000001$$

From these four quantities it is easy to conclude that the secular terms are

$$n\delta z = -0.0000153nt \sin (-g) - 0.0007144nt \cos (-g)$$

$$\nu = -0.000077nt \cos (-g) + 0.0003572nt \sin (-g)$$

$$\frac{u}{\cos i} = +0.0002201nt \sin (-g) - 0.0001852nt \cos (-g)$$

The terms of  $n\delta z$  and  $\nu$ , which depend on the elongation of Venus from Jupiter, are\*

$$n\delta z = + \circ''.0675 \sin(9 - 4) \qquad \qquad \nu = + \circ''.0675 \cos(9 - 4)$$

Action of the Earth on Jupiter.

In this case

$$\log \alpha = 9.2837668 \qquad \log b_{\frac{1}{2}}^{(0)} = 0.30511 \qquad \log b_{\frac{1}{2}}^{(1)} = 9.28988 \qquad \log b_{\frac{1}{2}}^{(3)} = 8.44939$$

$$\log \alpha \frac{db_{\frac{1}{2}}^{(0)}}{d\alpha} = 8.58591 \qquad \log \alpha \frac{db_{\frac{1}{2}}^{(1)}}{d\alpha} = 9.30214 \qquad \log \alpha \frac{db_{\frac{1}{2}}^{(3)}}{d\alpha} = 8.75728$$

$$\log \alpha^2 \frac{d^2b_{\frac{1}{2}}^{(0)}}{d\alpha^2} = 8.62181 \qquad \log \alpha^2 \frac{d^2b_{\frac{1}{2}}^{(1)}}{d\alpha^2} = 8.23752 \qquad \log \alpha^2 \frac{d^2b_{\frac{1}{2}}^{(3)}}{d\alpha^2} = 8.78433$$

$$\log \alpha^3 \frac{d^3b_{\frac{1}{2}}^{(0)}}{d\alpha^3} = 8.02093 \qquad \log \alpha^3 \frac{d^3b_{\frac{1}{2}}^{(1)}}{d\alpha^3} = 8.30187 \qquad \log \alpha^3 \frac{d^3b_{\frac{1}{2}}^{(3)}}{d\alpha^2} = 8.06368$$

$$\log \alpha^4 \frac{d^4b_{\frac{1}{2}}^{(0)}}{d\alpha^4} = 8.12288 \qquad \log \alpha^4 \frac{d^4b_{\frac{1}{2}}^{(1)}}{d\alpha^4} = 7.95070 \qquad \log \alpha^4 \frac{d^4b_{\frac{1}{2}}^{(3)}}{d\alpha^4} = 8.16093$$

$$\log \alpha b_{\frac{1}{2}}^{(1)} = 9.07533 \qquad \log \alpha^2 b_{\frac{1}{2}}^{(0)} = 8.96871 \qquad \log \alpha^2 b_{\frac{1}{2}}^{(0)} = 8.13844$$

$$\log \alpha^2 \frac{db_{\frac{1}{2}}^{(0)}}{d\alpha} = 8.85658 \qquad \log \alpha^2 \frac{db_{\frac{1}{2}}^{(1)}}{d\alpha} = 9.13378 \qquad \log \alpha^2 \frac{db_{\frac{1}{2}}^{(3)}}{d\alpha} = 8.78328$$

$$\log \alpha^3 \frac{d^3b_{\frac{1}{2}}^{(0)}}{d\alpha^2} = 8.94979 \qquad \log \alpha^3 \frac{d^3b_{\frac{1}{2}}^{(1)}}{d\alpha^2} = 8.74229 \qquad \log \alpha^3 \frac{d^3b_{\frac{1}{2}}^{(2)}}{d\alpha^2} = 8.88564$$

The constant term of  $\nu$  is

$$\nu = + 0''.2189$$

<sup>\*</sup> For the formulæ of computation see Mécanique Céleste, Tome I, pp. 279, 280.

The non-periodic portion of  $\frac{\mathbf{a}'}{\triangle}$  contains the following terms :

$$\begin{split} \frac{\mathbf{a}'}{\triangle} &= \quad [8.17224] \, (e^2 + e'^2) \\ &+ [8.87474] \, \sin^4 \frac{\mathbf{I}}{2} \mathbf{J} \\ &+ [6.63508] \, e^4 \\ &+ [6.63508] \, e^4 \\ &+ [8.30292] \, e'^4 \\ &- [9.01985] \, (e^2 + e'^2) \, \sin^2 \frac{\mathbf{I}}{2} \mathbf{J} \\ &+ [8.41780] \, e^2 e'^2 \\ &- [8.28145] \, ee'^3 \, \cos \left(\Pi' - \Pi\right) + [8.93970] \, ee' \, \sin^2 \frac{\mathbf{I}}{2} \mathbf{J} \, \cos \left(\Pi' - \Pi\right) - [7.79205] \, e^3 e' \, \cos \left(\Pi' - \Pi\right) \\ &+ [9.20601] \, e^2 \, \sin^2 \frac{\mathbf{I}}{2} \mathbf{J} \, \cos \left(\Pi' - \Pi\right) + [8.67277] \, ee' \, \sin^2 \frac{\mathbf{I}}{2} \mathbf{J} \, \cos \left(\Pi' + \Pi\right) + [7.28650] \, e^2 e'^2 \, \cos \left(\Pi' - \Pi\right) \end{split}$$

In which we have

$$J = 1^{\circ} 18' 42''$$
.10  $\Pi' = 92^{\circ} 59' 49''$   $\Pi = 181^{\circ} 25' 20''$ 

From this expression we find

$$-\frac{1}{e'}\frac{d\left(\frac{\mathbf{a}'}{\triangle}\right)}{d\Pi'} = +0.0001198$$

$$-\frac{d\left(\frac{\mathbf{a}'}{\triangle}\right)}{de'} = -0.0014394$$

$$\frac{d\left(\frac{\mathbf{a}'}{\triangle}\right)}{dJ} = -0.0006832$$

$$\frac{1}{\sin J}\left[\frac{d\left(\frac{\mathbf{a}'}{\triangle}\right)}{d\Pi} + \cos J\frac{d\left(\frac{\mathbf{a}'}{\triangle}\right)}{d\Pi'}\right] = -0.0000003$$

From these four quantities it is easy to conclude that the secular terms are

$$n\delta z = -0.0001530nt \sin (-g) - 0.0018372nt \cos (-g)$$

$$v = -0.0000765nt \cos (-g) + 0.0009186nt \sin (-g)$$

$$\frac{u}{\cos i} = -0.0004354nt \sin (-g) + 0.0000230nt \cos (-g)$$

The terms of  $n\delta z$  and  $\nu$ , which depend on the elongation of the Earth from Jupiter, are

$$n\delta z = + o''.1225 \sin(5 - 4)$$
  $v = + o''.1225 \cos(5 - 4)$ 

Action of Mars on Jupiter.

In this case

$$\log \alpha = 9.4666639 \qquad \log b_{\frac{1}{2}}^{(0)} = 0.31071 \qquad \log b_{\frac{1}{2}}^{(1)} = 9.48119 \qquad \log \alpha b_{\frac{1}{2}}^{(1)} = 9.48360$$

$$\log \alpha \frac{db_{\frac{1}{2}}^{(0)}}{d\alpha} = 8.97705 \qquad \log \alpha \frac{db_{\frac{1}{2}}^{(1)}}{d\alpha} = 9.51039$$

$$\log \alpha^2 \frac{d^2b_{\frac{1}{2}}^{(0)}}{d\alpha^2} = 9.05994 \qquad \log \alpha^2 \frac{d^2b_{\frac{1}{2}}^{(1)}}{d\alpha^2} = 8.83322$$

The constant term of  $\nu$  is

$$\nu = + 0^{\prime\prime}.0238$$

The non-periodic portion of  $\frac{\mathbf{a}'}{\triangle}$  contains the terms

$$\frac{\mathbf{a}'}{\triangle} = [8.58050](e^2 + e'^2) - [9.18256]\sin^2\frac{1}{2}\mathbf{J} - [8.44029]ee'\cos(\Pi' - \Pi)$$

In which we have

$$\log \sin J = 8.3988$$
  $\Pi' = 8^{\circ} 24'$   $\Pi = 329^{\circ} 46'$ 

Whence we conclude that the secular terms are

$$n\delta z = + 0.0002138nt \sin (-g) - 0.0002217nt \cos (-g)$$

$$v = + 0.0001069nt \cos (-g) + 0.0001108nt \sin (-g)$$

$$\frac{u}{\cos i} = -0.0000186nt \sin (-g) - 0.0001257nt \cos (-g)$$

Action of Mercury on Saturn.

In this case

$$\log \alpha = 8.6081398$$
  $\log b_{\frac{1}{2}}^{(0)} = 0.3012$   $\log \alpha \frac{db_{\frac{1}{2}}^{(0)}}{d\alpha} = 7.2171$ 

The constant term of  $\nu'$  is

$$\nu' = + o''.0138$$

The non-periodic portion of  $\frac{\mathbf{a}'}{\triangle}$  contains the terms

$$\frac{a'}{\triangle} = [6.7918](e^2 + e'^2) - [7.3939] \sin^2 \frac{1}{2} J - [5.7977] ee' \cos (\Pi' - \Pi)$$

In which we have

$$\log \sin J = 9.0469$$
  $\Pi' = 64^{\circ} 18'$   $\Pi = 49^{\circ} 27'$ 

Whence we conclude that the secular terms are

$$n'\delta z' = 0.000000n't \sin g' - 0.000005n't \cos g'$$

$$\nu' = 0.000000n't \cos g' - 0.000002n't \sin g'$$

$$\frac{u'}{\cos i'} = + 0.000005n't \sin g' + 0.000002n't \cos g'$$

Action of Venus on Saturn.

In this case

$$\log \alpha = 8.8796559$$
  $\log b_{\frac{1}{2}}^{(0)} = 0.3017$   $\log \alpha \frac{db_{\frac{1}{2}}^{(0)}}{d\alpha} = 7.7621$ 

The constant term of  $\nu'$  is

$$\nu' = \pm 0''.1624$$

The non-periodic portion of  $\frac{\mathbf{a}'}{\triangle}$  contains the terms

$$\frac{\mathbf{a}'}{\Delta} = [7.338\circ](e^2 + e'^2)^{\circ} - [7.94\circ1] \sin^2\frac{1}{2}\mathbf{J} - [6.6153]ee'\cos(\Pi' - \Pi)$$

In which we have

$$\log \sin J = 8.5544$$
  $\Pi' = 61^{\circ} 44'$   $\Pi = 101^{\circ} 4'$ 

Whence we conclude that the secular terms are

$$n'\delta z' = + 0.00002n't \sin g' - 0.000235n't \cos g'$$

$$v' = - 0.000001n't \cos g' - 0.000117n't \sin g'$$

$$\frac{u'}{\cos i'} = + 0.000067n't \sin g' - 0.000036n't \cos g'$$

The terms of  $n'\delta z'$  and  $\nu'$ , which depend on the elongation of Venus from Saturn, are

$$n'\delta z' = + o''.o_369 \sin(\varphi - \gamma) \qquad v' = + o''.o_369 \cos(\varphi - \gamma)$$

Action of the Earth on Saturn.

In this case

$$\log \alpha = 9.0203181 \qquad \log b_{\frac{1}{2}}^{(0)} = 0.3022 \qquad \log \alpha \frac{db_{\frac{1}{2}}}{d\alpha} = 8.0460$$

The constant term of  $\nu'$  is

$$\nu' = + 0''.2147$$

The non-periodic portion of  $\frac{a'}{\triangle}$  contains the terms

$$\frac{a'}{\triangle} = [7.6236](e^3 + e'^2) - [8.2257] \sin^2 \frac{1}{2} J - [7.0413]ee' \cos (\Pi' - \Pi)$$

In which we have

log sin J = 8.6387 
$$\Pi' = 157^{\circ} 46'$$
  $\Pi = 168^{\circ} 1'$ 

Whence we conclude that the secular terms are

$$n'\delta z' = + 0.00004n't \sin g' - 0.000579n't \cos g'$$

$$v' = -0.000002n't \cos g' - 0.000289n't \sin g'$$

$$\frac{u'}{\cos i'} = + 0.000086n't \sin g' + 0.000212n't \cos g'$$

The terms of  $n'\delta z'$  and v', which depend on the elongation of the Earth from Saturn, are

$$n'\delta z' = + \circ''.0672 \sin (5 - ?)$$
  $v' = + \circ''.0672 \cos (5 - ?)$ 

## Action of Mars on Saturn.

In this case

$$\log \alpha = 9.2032152$$

$$\log b_{\downarrow}^{(\bullet)} = 0.3038$$

$$\log \alpha = 9.2032152$$
  $\log b_{\frac{1}{2}}^{(0)} = 0.3038$   $\log \alpha \frac{db_{\frac{1}{2}}^{(0)}}{d\alpha} = 8.4190$ 

The constant term of  $\nu'$  is

$$\nu' = + 0''.0226$$

The non-periodic portion of  $\frac{a'}{\triangle}$  contains the terms

$$\frac{\mathbf{a}'}{\triangle} = [8.0014] (e^2 + e'^2) - [8.6035] \sin^2 \frac{\mathbf{I}}{2} \mathbf{J} - [7.6012] ee' \cos (\Pi' - \Pi)$$

In which we have

$$\log \sin J = 8.6153$$
  $II' = 113^{\circ} 5'$   $II = 356^{\circ} 19'$ 

$$\Pi' = 113^{\circ}$$
 5

$$II = 356^{\circ} 19^{\circ}$$

Whence we conclude that the secular terms are

$$n'\delta z' = -0.00044n't \sin g' - 0.000172n t \cos g'$$

$$v' = + 0.000022n't \cos g' - c.000086n't \sin g'$$

$$\frac{u'}{\cos i'} = + 0.000022n't \cos g' + 0.000022n't \cos g'$$

### CHAPTER VIII.

PERTURBATIONS OF THE SECOND ORDER WITH RESPECT TO DISTURBING FORCES IN THE LONGITUDES AND RADII-VECTORES, ARISING FROM THE MUTUAL ACTION OF JUPITER AND SATURN—DERIVATION OF THE FACTORS OF δT AND δT'.

Having completed the determination of all the perturbations of the first order with respect to the disturbing forces, we now arrive at the consideration of those of the second order. And, in the first place, we confine our attention to those of the fundamental arguments and radii-vectores which arise from the mutual action of Jupiter and Saturn. The more important part of these perturbations arises from attributing to the variables involved in T and T' no longer elliptical values but elliptical values augmented by the perturbations of the first order.

In a similar manner to Hansen's, we can put for Jupiter

$$\delta \mathbf{T} = \mathbf{A} n \delta z + \mathbf{B} \nu + \mathbf{C} \delta \frac{h}{h_0} + \mathbf{D} \frac{u}{\cos i} + \mathbf{E} \frac{u_1}{\cos i} + \mathbf{F} n' \delta z' + \mathbf{G} \nu' + \mathbf{H} \frac{u'}{\cos i'}$$

and for Saturn

$$\delta \mathbf{T}' = \mathbf{A}' n' \delta z' + \mathbf{B}' \nu' + \mathbf{C}' \delta \frac{h'}{h_0'} + \mathbf{D}' \frac{u'}{\cos i'} + \mathbf{E}' \frac{u_1'}{\cos i'} + \mathbf{F}' n \delta z + \mathbf{G}' \nu + \mathbf{H}' \frac{u}{\cos i}$$

Here  $u_1$  and  $u_1'$  denote the differential coefficients of u and u' with respect to the time. In the present chapter we shall be engaged in determining the factors entering into the right members of these two equations.

Of these factors, two are very readily found, viz, A and F. For, evidently,

$$\mathbf{A} = \frac{dT}{dg} \qquad \qquad \mathbf{F} = \frac{dT}{dg'}$$

As to B, we have

$$\mathbf{B}=r\frac{dT}{dr}$$

Then, supposing T to have the form

$$\mathbf{T} = \mathbf{A}a\frac{d\Omega}{dg} + \mathbf{B}ar\frac{d\Omega}{dr}$$

(where the reader is asked not to confound this A and B with the same symbols denoting two factors of  $\delta T$ ), we can suppose that B = V + X, where V denotes the portion of B which arises from making the forces in T variable with respect to r, and X the portion which arises from making the multipliers A and B so variable. Then it is plain that V has the expression

$$\mathbf{V} = \mathbf{A} \frac{d \cdot ar \frac{d\Omega}{dr}}{dg} + \mathbf{B}ar \frac{d \cdot r \frac{d\Omega}{dr}}{dr}$$

In order to find X we take the expression

$$\mathbf{T} = \frac{a}{\cos \varphi} \left\{ \left[ 2\frac{\rho}{r} \cos (f - \omega) - \mathbf{I} + 2\frac{h^2 \rho}{h_0^2 a \cos^2 \varphi} [\cos (f - \omega) - \mathbf{I}] \right] \frac{d\Omega}{df} + 2\frac{\rho}{r} \sin (f - \omega) r \frac{d\Omega}{dr} \right\}$$

whence

$$\mathbf{X} = -\frac{a}{\cos \, \varphi} \bigg[ \, z \frac{\rho}{r} \cos \left( f - \omega \right) \frac{d \varOmega}{d f} + z \frac{\rho}{r} \sin \left( f - \omega \right) r \frac{d \varOmega}{d r} \bigg]$$

But we have

$$\frac{d\Omega}{df} = \frac{r^2}{a^2 \cos \varphi} \frac{d\Omega}{dg} - \frac{er \sin f}{a \cos^2 \varphi} r \frac{d\Omega}{dr}$$

Thus

$$\mathbf{X} = -\frac{2r\rho}{a^2\cos^2\varphi}\cos\left(f - \omega\right)a\frac{d\Omega}{dg} - \frac{2\rho}{a\cos^3\varphi}\left[\sin\left(f - \omega\right) - e\sin\\omega\right]ar\frac{d\Omega}{dr}$$

Since, in computing the forces we have supposed  $\log r$  to be augmented by the constant term of its perturbations, but in deriving the multipliers A and B have given to r its elliptic value, it follows that, calling the constant term of  $\nu$ , c, we ought to write  $B(\nu - c) + cX$  for  $B\nu$ .

Differentiating, partially with reference to  $\frac{h}{h_0}$ , the expression for T, we get

$$\mathbf{C} = -\frac{4\rho}{\cos^3 \varphi} \left[ \cos (f - \omega) - \mathbf{I} \right] \frac{d\Omega}{df}$$

We note that

$$\mathbf{T} = \frac{a}{\cos \varphi} \frac{d\Omega}{df}$$

Whence, it follows that\*

$$C = 2[T + X + \overline{T}]$$

As to the other factor it can be got from either of the two equations †

$$\delta \frac{h}{\overline{h_0}} = -\left(\frac{d\delta z}{dt} + 2\nu\right) \qquad \qquad \delta \frac{h}{\overline{h_0}} = -\int \overline{\mathbf{T}} \mathbf{n} dt$$

We get D, E, and H from the following equations: ‡

$$D = A \frac{d \cdot a^{2} \frac{d\Omega}{dZ}}{dg} + B \left[ a^{2} r \frac{d \cdot \frac{d\Omega}{dZ}}{dr} + a^{2} \frac{d\Omega}{dZ} \right]$$

$$E = A a^{2} \frac{d\Omega}{dZ}$$

$$H = A a a' \frac{d \cdot \frac{d\Omega}{dZ'}}{da} + B a a' r \frac{d \cdot \frac{d\Omega}{dZ'}}{dr}$$

<sup>\*</sup>Auseinandersetzung, Abth. I, s. 128, gl. (69).

<sup>†</sup> Auseinandersetzung, Abth. I, ss. 128, 129, gl. (70), (71).

Auseinandersetzung, Abth. I, s. 130, gl. (72).

Lastly, we have\*

$$G = -V - T$$

In all these equations A and B denote the same multipliers as appear in T.

In these expressions four functions of the co-ordinates are present which did not appear in the determination of the first-order terms.

For Jupiter we have †

$$\frac{a}{\mu} \frac{d\left(r\frac{d\Omega}{dr}\right)}{dr} = \frac{3}{4} \left(\alpha^{2} \frac{r^{2}}{a^{2}} - \frac{r'^{2}}{a'^{2}}\right)^{3} \left(\frac{a'}{\Delta}\right)^{5} - \frac{r'^{2}}{a'^{2}} \left(\frac{a'}{\Delta}\right)^{3} + \frac{1}{4} \frac{a'}{\Delta} - a' \frac{r}{r'^{2}} H$$

$$\frac{d\left(\alpha^{2} \frac{d\Omega}{dZ}\right)}{dr} = -\frac{3}{2} \mu \alpha \sin J \left\{ \left(\alpha^{2} \frac{r^{2}}{a^{2}} - \frac{r'^{2}}{a'^{2}}\right) \left(\frac{a'}{\Delta}\right)^{5} + \left(\frac{a'}{\Delta}\right)^{3} \right\} \frac{r'}{a'} \sin (f' + \Pi')$$

$$aa' \frac{d\Omega}{dZ'} = \mu \alpha \sin J \left\{ -\left(\frac{a'}{\Delta}\right)^{3} + \left(\frac{a'}{r'}\right)^{3} \right\} \frac{r}{a} \sin (f + \Pi)$$

$$\frac{d\left(aa' \frac{d\Omega}{dZ'}\right)}{dr} = \mu \alpha \sin J \left\{ \frac{3}{2} \left(\alpha^{2} \frac{r^{2}}{a^{2}} - \frac{r'^{2}}{a'^{2}}\right) \left(\frac{a'}{\Delta}\right)^{5} + \frac{1}{2} \left(\frac{a'}{\Delta}\right)^{3} + \left(\frac{a'}{r'}\right)^{3} \right\} \frac{r}{a} \sin (f + \Pi)$$

For Saturn the similar quantities are

$$\frac{a'}{\mu'}r'\frac{d\left(r'\frac{d\Omega'}{dr'}\right)}{dr'} = \frac{3}{4}\left(\alpha^2\frac{r^2}{a^2} - \frac{r'^2}{a'^2}\right)^2\left(\frac{a'}{\Delta}\right)^5 - \alpha^2\frac{r^2}{a^2}\left(\frac{a'}{\Delta}\right)^3 + \frac{1}{4}\frac{a'}{\Delta} - a'\frac{r'}{r^2}H$$

$$r'\frac{d\left(\alpha'^2\frac{d\Omega'}{dZ'}\right)}{dr'} = -\frac{3}{2}\mu'\alpha\sin\int\left\{\left(\alpha^2\frac{r^2}{a^3} - \frac{r'^2}{a'^2}\right)\left(\frac{a'}{\Delta}\right)^5 - \left(\frac{a'}{\Delta}\right)^3\right\}\frac{r}{a}\sin\left(f + \Pi\right)$$

$$a\alpha'\frac{d\Omega'}{dZ} = \mu'\alpha\sin\int\left\{\left(\frac{a'}{\Delta}\right) - \frac{1}{\alpha^3}\left(\frac{a}{r}\right)^3\right\}\frac{r'}{a'}\sin\left(f' + \Pi'\right)$$

$$r'\frac{d\left(\alpha\alpha'\frac{d\Omega'}{dZ}\right)}{dr'} = \mu'\alpha\sin\int\left\{\frac{3}{2}\left(\alpha^2\frac{r^2}{a^2} - \frac{r'^2}{a'^2}\right)\left(\frac{a'}{\Delta}\right)^5 - \frac{1}{2}\left(\frac{a'}{\Delta}\right)^5 - \frac{1}{a^3}\left(\frac{a}{r}\right)^3\right\}\frac{r'}{a'}\sin\left(f' + \Pi'\right)$$

For the principal multiplier involved in these expressions, from the data at page 59, we have

$$\alpha^{2} \frac{r^{2}}{a^{2}} - \frac{r'^{2}}{a'^{2}} = - [9.8490745]$$

$$+ 2[8.7484582] \cos g' - 2[8.1564087] \cos g$$

$$+ 2[6.8947428] \cos 2g' - 2[6.2375704] \cos 2g$$

$$+ 2[5.3420289] \cos 3g' - 2[4.6197410] \cos 3g$$

$$+ 2[3.9142411] \cos 4g' - 2[3.1268416] \cos 4g$$

<sup>\*</sup>Auseinandersetzung, Abth. I, s. 130, gl. (74).

<sup>†</sup> Auseinandersetzung, Abth. I, s. 120.

We then multiply the expression for  $\left(\frac{a'}{\triangle}\right)^s$ , given at pages 53-56, by this factor, and the product again by three-fourths of this factor, and thus obtain

| Arg=i'g'+ig         | $\left(\alpha^{\frac{q-r^2}{\alpha^2}} - \frac{r'^2}{\alpha'^2}\right) \left(\frac{\alpha'}{\triangle}\right)^6$ |                            | $\frac{3}{4}\left(\alpha^2\frac{r^2}{\mathbf{a}^3}-\frac{r'^2}{\mathbf{a}^{\prime 2}}\right)^2\left(\frac{\mathbf{a}'}{\triangle}\right)^6$ |                    | $ \frac{\left(\alpha^{2}\frac{r^{2}}{a^{3}} - \frac{r'^{2}}{a'^{2}}\right) \times}{\left(\frac{a'}{\triangle}\right)^{5}\frac{r'}{a'}\sin\left(f' + \Pi'\right)} $ |                   | $-\left(\alpha^2 \frac{r^2}{a^2} - \frac{r^2}{a^2}\right) \times \left(\frac{a'}{\Delta}\right)^5 \frac{r}{a} \sin\left(f + \Pi\right)$ |                |

In order to form the expressions for the forces in the second-order terms we still need developments for the two quantities

$$\left(\frac{\mathbf{a}'}{r'}\right)^3 \frac{r}{\mathbf{a}} \sin \left(f + \Pi\right) \qquad \qquad -\frac{\mathbf{I}}{\alpha^3} \left(\frac{\mathbf{a}}{r}\right)^3 \frac{r'}{\mathbf{a}'} \sin \left(f' + \Pi'\right)$$

The expression for  $\left(\frac{a}{r}\right)^{s}$  is\*

$$\left(\frac{\mathbf{a}}{\mathbf{r}}\right)^{\mathbf{a}} = \frac{1}{\cos^{3}\varphi} + \left(\frac{3}{2}e + \frac{27}{16}e^{3}\right)\cos g + \left(\frac{9}{4}e^{2} + \frac{7}{4}e^{4}\right)\cos 2g + \frac{53}{16}e^{3}\cos 3g + \frac{231}{48}e^{4}\cos 4g + \dots$$

with a similar formula for  $\left(\frac{a'}{r'}\right)^3$ 

When the numerical values of e and e' are substituted we obtain

$$\left(\frac{\mathbf{a}'}{r'}\right)^3 = [0.00205] + 2[8.92625] \cos g' + 2[7.85050] \cos 2g' + 2[6.76604] \cos 3g'$$
$$\left(\frac{\mathbf{a}}{r}\right)^3 = [0.00152] + 2[8.86066] \cos g + 2[7.71983] \cos 2g + 2[6.57045] \cos 3g$$

The expressions for the factors  $\frac{r}{a} \sin(f + \Pi)$  and  $\frac{r'}{a'} \sin(f' + \Pi')$  have already been given (page 60), and we obtain the products

| Arg=i'g'+ig  | $\left(\frac{\mathbf{a}'}{r'}\right)^3 \frac{r}{\mathbf{a}}$ si   | n (f+II)  | Arg=i'g'+ig   | $-\frac{1}{\alpha^3}\left(\frac{a}{r}\right)^3\frac{r'}{a'}$                                  | $-\frac{1}{\alpha^3} \left(\frac{\mathbf{a}}{\tau}\right)^3 \frac{r'}{\mathbf{a}'} \sin\left(f + \Pi\right)$ |  |  |

Before we can write the expressions for the first eight factors of  $\delta T$  we have to pass through the intermediate stage of deriving V, X, and  $\overline{T}$ . It will be seen that in all cases, except that of X, the factors involving  $\gamma$  are the factors A and B, whose expressions have been given at pages 73, 74. In the case of X, putting

$$X = Ma \frac{d\Omega}{dg} + Nar \frac{d\Omega}{dr}$$

we have

$$\mathbf{M} = -\frac{2r\rho}{\mathbf{a}^2\cos^2\varphi}\cos\left(f - \omega\right) \qquad \qquad \mathbf{N} = -\frac{2\rho}{\mathbf{a}\,\cos^3\varphi}\left[\sin f\cos\omega - (\cos f + e)\,\sin\,\omega\right]$$

For a similar reason, as in deriving the expression for T, we can dispense with any direct computation of the terms of  $\delta T$  involving higher multiples of  $\gamma$  than the first, as all such terms in W are computed very readily by the formulæ of page 74. This abbreviation in determining T is applicable, no matter how far the approximation may be pushed; it is also true for each portion of T under restrictions which are readily seen. In consequence, availing ourselves of the quantities P and Q of page 63, in M and N, it suffices to put

$$\frac{\rho}{a}\cos\,\omega = \frac{1}{2}P_0 + P_1\cos\,\gamma \qquad \qquad \frac{\rho}{a}\sin\,\omega = Q_1\cos\,\varphi\,\sin\,\gamma$$

and we also have

$$\frac{r}{a}\cos f = \frac{1}{2}P_0 + P_1\cos g + P_2\cos 2g + P_3\cos 3g + \dots$$

$$\frac{r}{a}\sin f = \cos \varphi \left[Q_1\sin g + Q_2\sin 2g + Q_3\sin 3g + \dots\right]$$

$$\frac{\cos f + e}{\cos \varphi} = \cos \varphi \left[Q_1\cos g + 2Q_2\cos 2g + 3Q_3\cos 3g + \dots\right]$$

$$\frac{\sin f}{\cos \varphi} = P_1\sin g + 2P_2\sin 2g + 3P_3\sin 3g + \dots$$

From these equations we derive

$$\begin{aligned} \mathbf{M} &= -\frac{\mathbf{P}_0}{\cos^2 \varphi} \left[ \frac{1}{2} \mathbf{P}_0 + \mathbf{P}_1 \cos g + \mathbf{P}_2 \cos 2g + \mathbf{P}_3 \cos 3g + \dots \right] \\ &- \frac{i \mathbf{E}_i + \infty}{i \mathbf{E}_i} \left[ \frac{\mathbf{P}_1 \mathbf{P}_i}{\cos^2 \varphi} \pm \mathbf{Q}_1 \mathbf{Q}_i \right] \cos \left( \gamma \mp ig \right) \\ \mathbf{N} &= -\frac{\mathbf{P}_0}{\cos^2 \varphi} \left[ \mathbf{P}_1 \sin g + 2 \mathbf{P}_2 \sin 2g + 3 \mathbf{P}_3 \sin 3g + \dots \right] \\ &+ \frac{i \mathbf{E}_i - \infty}{i \mathbf{E}_i} \left[ \mathbf{Q}_1 \mathbf{Q}_i \pm \frac{\mathbf{P}_1 \mathbf{P}_i}{\cos^2 \varphi} \right] \sin \left( \gamma \mp ig \right) \end{aligned}$$

It is evident that M and N are connected by the equation

$$N = -\frac{dM}{dg}$$

Applying these formulæ to Jupiter we get

```
N = + 2[8.8601562] \sin g + 2[0.0000005] \sin (\gamma - g) 
+ 2[7.5432936] \sin 2g + 2[8.6831799] \sin (\gamma - 2g) 
+ 2[6.2776045] \sin 3g + 2[7.4175119] \sin (\gamma - 3g) 
+ 2[5.0345572] \sin 4g + 2[6.1744773] \sin (\gamma - 4g) 
- 2[6.76559] \sin (\gamma + g) 
- 2[5.36968] \sin (\gamma + 2g)
```

And, similarly for Saturn, we get

```
M' = - [8.1518373]
                                               N' = + 2[8.9255751] \sin g'
      + 2[8.9255751] \cos g'
                                                     + 2[7.6738057] \sin 2g'
      + 2[7.3727757] \cos 2g'
                                                     + 2[6.4732174] \sin 3g'
      + 2[5.9960961] \cos 3g'
      + 2[4.6932130] \cos 4g'
                                                     + 2[5.2952730] \sin 4g'
      + 2[8.9255751] \cos y'
                                                     + 2[0.0000000] \sin (\gamma' - g')
                                                     + 2[8.7482885] \sin(y' - 2g')
      -2[0.0000009] \cos(\gamma' - g')
                                                     + 2[7.5477287] \sin(\gamma' - 3g')
      -2[8.4472585]\cos(\gamma'-2g')
                                                     + 2[6.3698013] \sin(\gamma' - 4g')
      -2[7.0706074]\cos(\gamma'-3g')
      -2[5.7677413]\cos(\gamma'-4g')
                                                     + 2[5.2047001] \sin(\gamma' - 5g')
                                                     -2[6.89630] \sin (\gamma' + g')
      -2[4.5057301]\cos(\gamma'-5g')
      -2[6.89630]\cos(\gamma' + g')
                                                     -2[5.56550] \sin(\gamma' + 2g')
      -2[5.26447]\cos(\gamma'+2g')
```

We can now give the values of V and X. It is thought unnecessary to give the partial derivatives with respect to g or g' of any expression which has already been given, for the reason that they can so easily be formed. The expressions for B and G are appended:

| A      | rg=             | V               |                 | X                         |                   | В               |                 | G                  |                   |

In order to get the value of C we need that of  $\overline{T}$ . This can be got by making  $\gamma$  equal to g in the expression for T, taking care to derive the terms involving  $\pm 2\gamma$ ,  $\pm 3\gamma$ , etc., by means of the process noted at page 74, or more readily by the equation

$$\mathbf{T} = \frac{\mathbf{I}}{n} \frac{d}{dt} \left( \frac{d\delta z}{dt} + 2\nu \right)$$

For Jupiter we have the following expression:

| Arg=19 +19   sin.   cos.   Arg=19 +19   sin.   cos.   | A '/ 4 . !  | Ī               |          |             | Ī        |          |
|---|-------------|-----------------|----------|-------------|----------|----------|
| 0   | Arg=i'g'+ig | sin.            | cos.     | Arg=i'g'+ig | sin.     | cos.     |
| 0-1   | i' i        | //              | _        | i' i        | 1        |          |

## CHAPTER IX.

CALCULATION OF THE TERMS OF  $\delta T$  AND  $\delta T'$  WHOSE ARGUMENTS ARE  $\gamma$  AND  $\gamma'$ .

Being now in possession of the several factors of the terms of  $\delta T$  and  $\delta T'$ , we could proceed immediately to the calculation of the terms, strictly of the second order, which arise from these quantities. But the more important parts of these functions are the terms coming from the secular variations of the elements. This prominence is kept up in the terms of the third, and apparently of all higher orders. And it is, perhaps, the most surprising instance in the planetary theories of a lack of convergence that the secular variations of the eccentricities and places of the perihelia of Jupiter and Saturn are augmented about a fourth part by the terms of the second order with respect to disturbing forces. Since the mass of Jupiter is less than  $\frac{1}{1000}$  of that of the Sun it would naturally be supposed that the ratio of the second to the first-order terms would be somewhere in the neighborhood of this fraction. It is, however, 250 times larger.

By far the larger portions of these second-order terms arise from the terms of  $\delta T$  and  $\delta T'$ , having severally the arguments  $\gamma$  and  $\gamma'$ . By computing these portions at the outset, and annexing them to the first-order terms corresponding to the same arguments before proceeding to the general calculation of  $\delta T$  and  $\delta T'$ , we shall include in the determination of the second-order terms the more notable portion of the third-order terms. In like manner, on arriving at the general computation of the latter, we shall first compute the terms having the arguments  $\gamma$  and  $\gamma'$ , and annexing them to the second-order terms, shall then be able to include the more remarkable portion of the fourth-order terms in that of the third. The modifications which this mode of proceeding requires in the values of the second factors are readily perceived.

In this connection it will be interesting to see how much each set of terms of the second factors of  $\delta T$  and  $\delta T'$  contributes to the terms under consideration. Hence, I enter into some details relative to them. Defining these sets of terms by the arguments on which they depend, the general form of which is i'g' + ig, I have arranged in the following table the component parts of the coefficients of  $\sin \gamma$  and  $\cos \gamma$  in  $\delta T$  and of  $\sin \gamma'$  and  $\cos \gamma'$  in  $\delta T'$ . The numbers given are in units of the seventh decimal of the second of arc for  $\delta T$  and in units of the sixth decimal for  $\delta T'$ . They arise from multiplying the terms in the second factors having the argument i'g' + ig by the terms of the first factors having the two arguments  $\pm \gamma + i'g' + ig$  in the case of  $\delta T$ , or  $\pm \gamma' + i'g' + ig$  in the case of  $\delta T'$ . Thus, it is plain that, since there are

eight terms in both  $\delta T$  and  $\delta T'$ , the numbers tabulated are the sums of thirty-two component parts. However, in many cases some of these have no significant values:

It will be perceived that the arguments 2g'-g, 4g'-2g, 5g'-2g, and 5g'-3g contribute the largest portions to these terms of the second order. In the case of the three latter arguments the cause of the largeness of the portions contributed is the division by the small divisor 5n'-2n or its square. But in the case of the first, 2g'-g, this cause does not operate, and yet for Jupiter this argument contributes the largest quota. Hence, it is hardly correct to say that the superior magnitude of the terms we are considering is due to the smallness of 5n'-2n. However, 2g'-g may be considered as an argument of long period, since  $\frac{n}{2n'-n}$  is about 5. But the actual explanation of the magnitude of the coefficients, whose component parts have just been given, appears to be that the terms of T and T' having the arguments  $\gamma$  and  $\gamma'$ 

are exceptionally small. This will be apparent when we write them in connection with the maximum terms, as follows:

$$T = - \frac{7}{1.142} \sin(-\gamma) + \frac{7}{1.017} \cos(-\gamma) 
- 47.872 \sin(-\gamma + 2g'-g) + 20.556 \cos(-\gamma + 2g'-g)$$

$$T' = 8.631 \sin \gamma' - 5.350 \cos \gamma' 
+ 413.905 \sin(\gamma' - g') + 1977.900 \cos(\gamma' - g)$$

With them may also be compared the largest terms of the factors G and G'

$$G = {}^{167.70} \sin (-\gamma + 2g' - g) - {}^{71.60} \cos (-\gamma + 2g' - g)$$

$$G' = -782.26 \sin (\gamma' - g) - 3729.47 \cos (\gamma' - g)$$

Adding the components of  $\delta T$  and  $\delta T'$  given in the preceding table, we obtain

$$\delta \mathbf{T} = -0.2260338 \sin (-\gamma) + 0.2563282 \cos (-\gamma)$$

$$\delta \mathbf{T}' = +1.771981 \sin \gamma' -1.345783 \cos \gamma'$$

It is desirable to have the means of readily changing these expressions, so as to correspond to any new values of the masses of Jupiter and Saturn that may be adopted. Thus, by adding the five terms of  $\delta T$  involving the factors A to E, we find that the portion of  $\delta T$  proportional to  $\left(\frac{m'}{1+m}\right)^2$  is

$$-o''.0351410 \sin(-\gamma) + o''.0526059 \cos(-\gamma)$$

and by adding the three terms involving the factors F to H, we find that the portion of  $\delta T$  proportional to  $\frac{m}{1+m'} \cdot \frac{m'}{1+m}$  is

$$-0''$$
.1908928  $\sin(-\gamma) + 0''$ .2037223  $\cos(-\gamma)$ 

In like manner, the portion of  $\delta T'$  proportional to  $\left(\frac{m}{r+m'}\right)^2$  is

$$+ 1''.337009 \sin \gamma' - 1''.066713 \cos \gamma'$$

and the portion proportional to  $\frac{m}{1+m'} \cdot \frac{m'}{1+m}$  is

$$+ \circ''.434972 \sin \gamma' - \circ''.279070 \cos \gamma'$$

By joining the second-order terms, which arise from  $\delta T$  and  $\delta T'$ , to the principal secular terms of the first order of  $n\delta z$  and  $n'\delta z'$ , obtained in preceding chapters, we have the following exhibit:

```
n\delta z

                             +1.138326n't \sin g' + 1.600384n't \cos g'
           Sum
```

The secular term of  $\delta \frac{h}{h_0}$  is the same as the non-periodic secular term of  $-2\nu$ .

## CHAPTER X.

## CALCULATION OF THE PORTION OF ST NOT FACTORED BY nt.

In determining the portion of  $\delta T$ , which follows, a table of limits for the retention of terms for each argument  $\pm \gamma + i'g' + ig$  was computed from the formula

$$\frac{i'n'+in}{n} \cdot \frac{i'n'+(i\pm 1)n}{n} \times \circ''.0005$$

and only those combinations were retained in which at least one coefficient exceeded this limit. It has been deemed advisable to give separately the eight products whose sum forms  $\delta T$ :

| A             | g=    | A             | $n\delta z$     | B(v —              | c) + Xc          | Fn                      | 'δε'               | G(v'       | — c')                       |

## CHAPTER XI.

## CALCULATION OF THE PORTION OF ST FACTORED BY nt.

In determining the part of  $\delta T$  having the factor nt a degree of precision 300 times greater than that used in deriving the part not multiplied by nt has been employed. In the following table the factor nt has been omitted, and for convenience all the coefficients have been multiplied by 100000:

| Arg=            | An                | $\delta z$      | Β(ν            | — c)            | Fn              | 'δz'           | G( u'         | c')                |

# CHAPTER XII.

SECOND-ORDER PERTURBATIONS OF THE MEAN ANOMALY AND RADIUS-VECTOR OF JUPITER, ARISING FROM THE MUTUAL ACTION OF THIS PLANET AND SATURN.

When the eight terms of  $\delta T$ , given in the two preceding chapters, are added the following expression is obtained:

| $Arg = \kappa \gamma + i'g' + ig$ | $\delta 	ext{T}$         |  |  |  |

This expression for  $\delta T$  must be subjected to the same treatment as that we employed in Chapter II for deriving  $\frac{d \cdot \delta z}{dt}$  and  $\frac{d\nu}{dt}$  from T; that is, we must obtain  $\overline{\delta W_0}$  and  $-\frac{1}{2}\left(\frac{\overline{d \cdot \delta W_0}}{d\gamma}\right)$  from  $\delta W_0$ , the latter being given by the equation

$$\delta W_0 = \int \delta T n dt$$

In deriving  $\delta W_0$  from  $\delta T$ , in the terms whose arguments involve 5g'-2g or 10g'-4g, it seems advantageous to equate the motion of the argument. In this way

a more rapid approximation to the correct values of these terms is secured. Joining T and  $\delta$ T together, and supposing that the argument is denoted by  $\chi$ , let

$$T + \delta T = (a + bnt) \sin \chi + (c + dnt) \cos \chi$$

By means of the equations

these terms can be approximately expressed

$$T + \delta T = (A + Bnt) \sin (\chi + K + \kappa nt)$$

and thence by integrating

$$W_0 + \delta W_0 = -\mu (A + Bnt) \cos (\chi + K + \kappa nt) + \mu^2 B \sin (\chi + K + \kappa nt)$$

where  $\mu$  denotes the integrating factor for the argument  $\chi + \kappa nt$ . In the special cases we treat  $\mu$  will be derived from either of the formulæ

$$\frac{1}{\mu} = \frac{5n' - 2n}{n} + \kappa \text{ or } \frac{1}{\mu} = \frac{10n' - 4n}{n} + \kappa$$

By developing the sine and cosine of the argument in powers of  $\kappa nt$ , and neglecting in the coefficients terms multiplied by  $n^2t^2$ , we get

$$\mathbf{W}_0 + \delta \mathbf{W}_0 = -\mu[a - \mu \mathbf{B} \sin \mathbf{K} + (b - \kappa \mu \mathbf{B} \cos \mathbf{K})nt] \cos \chi$$
$$+ \mu[c + \mu \mathbf{B} \cos \mathbf{K} + (d - \kappa \mu \mathbf{B} \sin \mathbf{K})nt] \sin \chi$$

By subtracting from this the value of  $W_{o}$ , found in Chapter II, we have the value of  $\delta W_{o}$ .

In the five terms we treat by this process there has been found:

| Arg.   | log A      | K            | log B       | log ×       | log μ     |
|--|------------|--------------|-------------|-------------|-----------|
| y + 5g' - 2g $5g' - 2g$ $-y + 5g' - 2g$ $10g' - 4g$ $-y + 10g' - 4g$ | 7. 8385    | 217 19 24    | 4. 2156     | 6. 8991n    | 1.8983560 |
|  | 9. 2905882 | 248 8 38.26  | 5. 4424349n | 6. 9088766n | 1.8989767 |
|  | 0. 3077026 | 176 39 35.74 | 6. 1611524n | 6. 7032188n | 1.8885772 |
|  | 7. 81648   | 133 13 55    | 3. 24871    | 6. 40327    | 1.56683   |
|  | 8. 8359    | 62 10        | 4. 1369     | 6. 2981     | 1.56770   |

By the aid of these quantities the terms of  $\delta W_0$  in question have been found as follows:

| Aza-vu tilal tia                   | $\delta \mathrm{W}_{\mathrm{o}}$  |   |  |  |
|------------------------------------|---|---|--|--|
| $Arg = \kappa \gamma + i'g' + ig'$ | cos.  | sin.  |  |  |

|                 |  | ]                  |

Calling the second-order terms, to be added to  $n\delta z$  and  $\nu$ ,  $n\delta^2 z$  and  $\delta \nu$ , they are determined by the equations\*

$$\frac{d \cdot n\delta^{2}z}{ndt} = \overline{\delta W_{0}} + \left(\frac{\overline{dW_{0}}}{d\gamma}\right) n\delta z + \nu^{2}$$

$$\frac{d \cdot \delta \nu}{ndt} = -\frac{1}{2} \left(\frac{\overline{d \cdot \delta W_{0}}}{d\gamma}\right) - \frac{1}{2} \left(\frac{\overline{d^{2}W_{0}}}{d\gamma^{2}}\right) n\delta z$$

It therefore remains to find the three products,  $(\frac{\overline{dW_0}}{d\gamma})n\delta z$ ,  $v^2$ , and  $-\frac{1}{2}(\frac{\overline{d^2W_0}}{d\gamma^2})n\delta z$ . The factor  $(\frac{\overline{dW_0}}{d\gamma})$  of the first has already been given in Chapter II, being equivalent to  $-2\frac{d\nu}{ndt}$ , and it is easy to square the value of  $\nu$  there given. The expressions of the two products to be employed in determining  $n\delta^2 z$  follow:

| Arg=i'g'+ig | $\left(\frac{d\mathbf{W}_{0}}{d\gamma}\right)$ | ) η δ z  |

The expression for  $-\frac{1}{2}\left(\frac{\overline{d^2W_0}}{\overline{dy^2}}\right)$  is obtained by differentiating, with respect to  $\gamma$ , the terms of  $-\frac{1}{2}\frac{dW_0}{d\gamma}$ , which has already been employed in Chapter II. However, in order not to have to return to this term when we compute the third-order terms, I have, before this differentiation, added to the latter quantity the expression for  $-\frac{1}{2}\frac{d \cdot \delta W_0}{d\gamma}$ , which has just been obtained. The expression for this factor, together with its product by  $n\delta z$ , is given in the following table:

| Arg=i'g'+ig | $-rac{1}{2}\Big(rac{d^2\mathrm{W_0}}{d\gamma^2}\Big)$ | $\left(rac{d^2 \overline{\mathrm{W}_0}}{d \gamma^2} ight)$ |

If we now add the three portions of  $\frac{d \cdot n\delta^2 z}{ndt}$ , which have just been given, we shall have the value of this quantity. In  $\overline{\delta W_0}$  we give  $k_0$  such a value that  $n\delta^2 z$  may have no term proportional to t, and  $k_1$  and  $k_2$  are so assumed that the terms having the argument g may vanish. For this it is found necessary to put  $k_1 = -0$ .4862 and  $k_2 = -0$ .8170. In integrating the terms depending on the arguments 5g' - 2g and 10g' - 4g we have equated the motion of the latter, and have proceeded in a way precisely similar to that followed in deriving  $\delta W_0$  from  $\delta T$ . By joining the first order

with the second order terms, it is found that, as far as these two arguments are concerned, we have

$$\frac{d \cdot n\delta z}{ndt} = \begin{cases} "" & "" & "" \\ [5.88438 + 0.01000896nt] \cos (5g' - 2g) + [-14.13462 + 0.00596165nt] \sin (5g' - 2g) \\ + [0.16091 + 0.00004537nt] \cos (10g' - 4g) + [-14.13462 + 0.00003542nt] \sin (10g' - 4g) \end{cases}$$

Setting aside quantities of the third order this expression can be replaced by the following:

$$\frac{d(n\delta z)}{ndt} = \frac{(1.1849912) - (7.2193138)nt}{(9.37255) + (4.7058)} \cos \left[ \frac{5g' - 2g + \frac{67}{23} \frac{7}{51.22} - (6.8768938)nt}{(6.3858) nt} \right]$$

The integrating factors for the equated arguments are given by

$$\log \mu = 1.8970002$$
  $\log \mu = 1.56699$ 

After neglecting certain quantities of the third order the integrated expression can be put under the form

By subtracting the corresponding terms of  $n\delta z$ , found in Chapter II, we get

$$n\delta^2 z = \begin{bmatrix} 51.3265 + 0.785671nt \end{bmatrix} \sin(5g' - 2g) + \begin{bmatrix} 118.2806 - 0.477027nt \end{bmatrix} \cos(5g' - 2g) + \begin{bmatrix} 6.9725 + 0.001673nt \end{bmatrix} \sin(10g' - 4g) + \begin{bmatrix} -7.3774 + 0.001308nt \end{bmatrix} \cos(10g' - 4g)$$

If we add the two portions of  $\frac{d \cdot \delta \nu}{ndt}$  we have the value of this quantity. In integrating we are obliged to derive the constant term of  $\delta \nu$  from another equation. It is known that this term is the same as that of the expression\*

$$-\frac{1}{6}\left(k_0+\frac{3}{2}\frac{e}{P_1}k_1\right)+\frac{1}{3}\left(\frac{d\cdot\delta z}{dt}+\frac{1}{2}\nu\right)^2+\frac{3}{4}\nu^2$$

 $k_0$  is equivalent to the negative of the sum of the constant terms of  $\delta \overline{W_0}$ ,  $\left(\frac{d\overline{W_0}}{d\gamma}\right)n\delta z$ , and  $\nu^2$ ; that is,  $k_0=+$ 0".1018. It has already been stated that  $k_1=-$ 0".4862. In computing the constant term of  $\left(\frac{d\cdot\delta z}{dt}+\frac{1}{2}\nu\right)^2$  it is necessary to take into account only the terms corresponding to the ten arguments having the largest coefficients. We make use of the expressions for  $\frac{d\cdot\delta z}{dt}$  and  $\nu$  given in Chapter II. It is found that this constant term is +0".1225. The constant term of  $\nu^2$  has already been found to be +0".0498. Thus, the constant term of  $\delta \nu$  is +0".0671.

The values of  $n\delta^2 z$  and  $\delta \nu$  follow. The proper number of decimals has been restored to the coefficients multiplied by nt and  $n^2t^2$ :

## CHAPTER XIII.

## CALCULATION OF THE PORTION OF ST' NOT FACTORED BY n't.

We have now to go through the same processes for Saturn as, in the three preceding chapters, we have gone through with for Jupiter. In determining the portion of  $\delta T'$ , which follows, a table of limits for the retention of terms for each argument  $\pm \gamma' + i'g' + ig$  was computed from the formulæ

$$\frac{i'n'+in}{n'}\cdot\frac{(i'\pm 1)n'+in}{n'}\times \circ''.\circ\circ 5$$

and only those combinations were retained in which at least one coefficient exceeded this limit. It has been deemed advisable to give separately the eight products whose sum forms  $\delta T'$ :

| $Arg = \\ \kappa \gamma' + i'g' + ig$ |    | $\mathbf{A}'n'\delta z'$ |                         | B'(v'-         | $\mathbf{B}'(\nu'-c')+\mathbf{X}'c'$ |                            | $\mathbf{F}'n\delta z$ |                    | ( - c)          |                  |
|---------------------------------------|----|--------------------------|-------------------------|----------------|--------------------------------------|----------------------------|------------------------|--------------------|-----------------|------------------|
|                                       |    | -ig                      | sin.                    | cos.           | sin.                                 | cos.                       | sin.                   | cos.               | sin.            | cos.             |

## CHAPTER XIV.

## CALCULATION OF THE PORTION OF ST' FACTORED BY n't.

In determining the part of  $\delta T'$  having the factor n't a degree of precision 200 times greater than that used in deriving the part not multiplied by n't has been employed. In the following table the factor n't has been omitted, and to avoid multiplicity of zeros all the coefficients have been multiplied by 10000:

| Ar         | σ=                 |     | A'n                   | ′δz′                      | B'                 | ν'                | F'1              | $\imath \delta z$ | G              | 'v               |

## CHAPTER XV.

SECOND-ORDER PERTURBATIONS OF THE MEAN ANOMALY AND RADIUS-VECTOR OF SATURN, ARISING FROM THE MUTUAL ACTION OF THIS PLANET AND JUPITER.

When the eight terms of  $\delta T'$ , given in the two preceding chapters, are added the following expression is obtained:

|                                       | 81                            | īν                           |
|---------------------------------------|-------------------------------|------------------------------|

|                                       |                     |                |

In deriving  $\delta W_0'$  from  $\delta T'$  it has been deemed advantageous to equate the motion of the arguments in the terms involving 5g'-2g and 10g'-4g. The formulæ for this have already been given (p. 275). In the two terms we treat by this process there has been found:

| Arg.    | log A      | K           | log B               | log ×       | $\log \mu$ |
|---------|------------|-------------|---------------------|-------------|------------|
| 5g'—2g  | 0. 4798525 | 68 o 23. 25 | 6. 8614088 <i>n</i> | 7. 1863943n | I. 4973782 |
| 10g'—4g | 9. 0047121 | 313 9 56. 7 | 4. 7292             | 6. 7424     | I. 1722875 |

By the aid of these quantities the terms of  $\delta W_0{}'$  in question have been found as follows:

|                   | δ  | <b>V</b> ₀′                                     |
|-------------------|--|---|
| Arg.              | cos.   | sin.  |
| 5g'—2g<br>10g'—4g | //<br>0. 922970. 1261798n't<br>1. 204420. 0006600n't | +4. 38773—0. 0767907n't —1. 26809+0. 0005106n't |

The expressions for  $\overline{\delta W_0}'$  and  $-\frac{1}{2}\Big(\frac{\overline{d\cdot\delta W_0}'}{d\gamma'}\Big)$  follow:

| $\overline{\delta W_0}'$ |   |  |  |

If we add the three portions of  $\frac{d \cdot n' \delta^2 z'}{n' dt}$ , which have just been given, we shall have the value of this quantity. In  $\overline{\delta W_0}'$  we give  $k_0$  such a value that  $n' \delta^2 z'$  may have no term proportional to t, and  $k_1$  and  $k_2$  are so assumed that the terms having the

argument g' may vanish. For this it is necessary to put  $k_0 = +1$ ".5316,  $k_1 = +0$ ."5432, and  $k_2 = +0$ ".3989.

In integrating the terms depending on the arguments 5g'-2g and 10g'-4g we have equated the motion of the latter, and have proceeded in a way precisely similar to that followed in deriving  $\delta W_0'$  from  $\delta T'$ . By joining the first order with the second order terms, it is found that, as far as these two arguments are concerned, we have

Setting aside quantities of the third order this expression can be replaced by the following:

$$\frac{d(n'\delta z')}{n'dt} = \begin{bmatrix} (1.9644830) - (8.3669461)n't \end{bmatrix} \cos \begin{bmatrix} 5g' - 2g + 247 & 26 & 44.14 - (7.2640621)n't \end{bmatrix} + \begin{bmatrix} (0.1504991) + (5.88018 & )n't \end{bmatrix} \cos \begin{bmatrix} 10g' - 4g + 133 & 0 & 34.7 & + (6.78501 & )n't \end{bmatrix}$$

The integrating factors for the equated arguments are given by

$$\log \mu = 1.5015038$$
  $\log \mu = 1.1719199$ 

After neglecting certain quantities of the third order the integrated expression can be put under the form

$$n'\delta z' = \begin{bmatrix} -1143.2024 - 4.660293n't \end{bmatrix} \sin(5g' - 2g) + \begin{bmatrix} -2691.4278 + 2.782008n't \end{bmatrix} \cos(5g' - 2g) + \begin{bmatrix} -14.3434 - 0.010128n't \end{bmatrix} \sin(10g' - 4g) + \begin{bmatrix} 15.3517 - 0.007920n't \end{bmatrix} \cos(10g' - 4g)$$

By subtracting the corresponding terms of  $n'\delta z'$ , found in Chapter II, we get

$$n'\delta^{2}z' = \begin{bmatrix} -114.0044 - 4.660293n't \end{bmatrix} \sin(5g' - 2g) + [-273.6868 + 2.782008n't] \cos(5g' - 2g) + [-16.8155 - 0.010128n't] \sin(10g' - 4g) + [-17.8091 - 0.007920n't] \cos(10g' - 4g)$$

If we add the two portions of  $\frac{d \cdot \delta \nu'}{n'dt}$  we have the value of this quantity. In integrating we get the constant term of  $\delta \nu'$  by the aid of the formula given at page 289. The constant term of  $\frac{1}{3} \left( \frac{d \cdot \delta z'}{dt} + \frac{1}{2} \nu' \right)^2$  is +0''.2374. Thus, the constant term of  $\delta \nu'$  is found to be +0''.2781.

In integrating the term depending on the argument 5g'-2g the motion of the latter has been equated. The first-order terms being included, we have

$$\frac{dv'}{n'dt} = [-\circ''.76834 - \circ''.\circ\circ311\circ8n't \sin(5g' - 2g) + [-1''.51690 + \circ''.\circ\circ19693n't] \cos(5g' - 2g)$$

$$= [(\circ.23\circ549\circ) - (6.54556)n't] \sin[5g' - 2g + 243° 8' 12''.78 - (7.33352)n't]$$

The logarithm of the integrating factor is 1.5059163, and we obtain

$$\mathbf{v}' = \begin{bmatrix} 24''.9523 + 0''.099369n't \end{bmatrix} \cos (5g' - 2g) + \begin{bmatrix} -48''.4634 + 0''.063826n't \end{bmatrix} \sin (5g' - 2g)$$

By subtracting the corresponding terms of  $\nu'$ , in Chapter II, we get

$$\delta \nu' = [\circ''.8754 + \circ''.\circ99369n't] \cos{(5g'-2g)} + [-2''.8311 + \circ.''\circ63826n't] \sin{(5g'-2g)}$$

The values of  $n'\delta^2z'$  and  $\delta\nu'$  follow:

## CHAPTER XVI.

PERTURBATIONS OF THE THIRD ORDER WITH RESPECT TO DISTURBING FORCES IN THE LONGI-TUDES AND RADII-VECTORES, ARISING FROM THE MUTUAL ACTION OF JUPITER AND SATURN— DETERMINATION OF THE FACTORS OF δ°T AND δ°T′.

The corrections to be applied to T and T', on account of terms of three dimensions with respect to disturbing forces, will be denoted by  $\delta^2$ T and  $\delta^2$ T'. In determining them it is important to reject all parts of the formulæ which afford insignificant terms, and thus reduce the very onerous labor involved. In this connection it will be seen, on referring to the previous elaboration of the second-order terms, that those involving the factors u and u' are generally insignificant and in the remaining cases quite small. As, in the third-order terms, these factors should give rise to still smaller terms, it is thought allowable to entirely neglect them. For like reasons, all terms arising through the consideration of  $\delta h$  and  $\delta h'$  will be neglected. Thus, we will consider only the four augmentations,  $n\delta z$ ,  $\nu$ ,  $n'\delta z'$ , and  $\nu'$ .

Then, applying TAYLOR's theorem, extended to any number of variables, to the functions T and T', we have

$$\begin{split} \delta^2 \mathbf{T} &= \quad \mathbf{A} n \delta^2 z + \mathbf{B} \delta \nu + \mathbf{F} n' \delta^2 z' + \mathbf{G} \delta \nu' \\ &+ \frac{\mathbf{I}}{2} \frac{d \mathbf{A}}{dg} (n \delta z)^2 + \frac{d \mathbf{A}}{dg'} (n \delta z) (n' \delta z') + \frac{\mathbf{I}}{2} \frac{d \mathbf{F}}{dg'} (n' \delta z')^2 \\ &+ \frac{d \mathbf{B}}{dg} (n \delta z) \nu + \frac{d \mathbf{B}}{dg'} (n' \delta z') \nu + \frac{d \mathbf{G}}{dg} (n \delta z) \nu' + \frac{d \mathbf{G}}{dg'} (n' \delta z') \nu' \\ &+ \frac{\mathbf{I}}{2} r^2 \frac{d^2 \mathbf{T}}{dr^2} \nu^2 + r r' \frac{d^2 \mathbf{T}}{dr dr'} \nu \nu' + \frac{\mathbf{I}}{2} r'^2 \frac{d^2 \mathbf{T}}{dr'^2} \nu'^2 \\ \delta^2 \mathbf{T}' &= \quad \mathbf{A}' n' \delta^2 z' + \mathbf{B}' \delta \nu' + \mathbf{F}' n \delta^2 z + \mathbf{G}' \delta \nu \\ &+ \frac{\mathbf{I}}{2} \frac{d \mathbf{A}'}{dg'} (n' \delta z')^2 + \frac{d \mathbf{A}'}{dg} (n \delta z) (n' \delta z') + \frac{\mathbf{I}}{2} \frac{d \mathbf{F}'}{dg} (n \delta z)^2 \\ &+ \frac{d \mathbf{B}'}{dg'} (n' \delta z') \nu' + \frac{d \mathbf{B}'}{dg} (n \delta z) \nu' + \frac{d \mathbf{G}'}{dg'} (n' \delta z') \nu + \frac{d \mathbf{G}'}{dg} (n \delta z) \nu \\ &+ \frac{\mathbf{I}}{2} r'^2 \frac{d^2 \mathbf{T}}{dr'^2} \nu'^2 + r r' \frac{d^2 \mathbf{T}'}{dr dr'} \nu \nu' + \frac{\mathbf{I}}{2} r^2 \frac{d^2 \mathbf{T}'}{dr^2} \nu^2 \end{split}$$

The four factors, A, B, F, and G, of the first line of each of these two expressions are the same as the factors, denoted by these symbols, employed in the computation of the second order terms, and the first factors of the two following lines are obtained from those just mentioned by partial differentiation with respect to g or g'. Thus,

eleven out of fourteen quantities involved in each of these expressions are determined in the easiest manner possible; a notable advantage resulting from the employment of Hansen's variables. But the first factors of the three terms in the last line of each expression must be specially computed. They all have the form

$$\mathbf{H_1}\!\!\left(\frac{\mathbf{a}'}{\triangle}\right)^{\!7}\!\!+\mathbf{H_2}\!\!\left(\frac{\mathbf{a}'}{\triangle}\right)^{\!5}\!\!+\mathbf{H_3}\!\!\left(\frac{\mathbf{a}'}{\triangle}\right)^{\!3}\!\!+\mathbf{H_4}\!\!\frac{\mathbf{a}'}{\triangle}\!\!+\mathbf{H_5}$$

The readiest method of obtaining them appears to be the following: Derive, in the first place, the two quantities

$$a_{0}\left(r\frac{d}{dr}\right)^{3}\Omega = \mu \left\{-\frac{15}{8}\left(\frac{a'}{\triangle}\right)^{7}\left(\alpha^{2}\frac{r^{2}}{a^{2}} - \frac{r'^{2}}{a'^{2}}\right)^{3} + \left(\frac{a'}{\triangle}\right)^{5}\left[\frac{9}{8}\left(\alpha^{2}\frac{r^{2}}{a^{2}} - \frac{r'^{2}}{a'^{2}}\right)^{2} + \frac{9}{2}\frac{r'^{2}}{a'^{2}}\left(\alpha^{2}\frac{r^{2}}{a^{2}} - \frac{r'^{2}}{a'^{2}}\right)\right] - \frac{1}{2}\left(\frac{a'}{\triangle}\right)^{3}\frac{r'^{2}}{a'^{2}} - \frac{1}{8}\left(\frac{a'}{\triangle}\right)^{3}\left(\alpha^{2}\frac{r^{2}}{a^{2}} - \frac{r'^{2}}{a'^{2}}\right) - \frac{1}{8}\frac{a'}{\triangle} - \frac{a'r}{r'^{2}}H\right\}$$

$$a_{0}'\left(r'\frac{d}{dr'}\right)^{3}\Omega' = \mu'\left\{\frac{15}{8}\left(\frac{a'}{\triangle}\right)^{7}\left(\alpha^{2}\frac{r^{2}}{a^{2}} - \frac{r'^{2}}{a'^{2}}\right)^{3} + \left(\frac{a'}{\triangle}\right)^{5}\left[\frac{9}{8}\left(\alpha^{2}\frac{r^{2}}{a^{2}} - \frac{r'^{2}}{a'^{2}}\right)^{2} - \frac{9}{2}\alpha^{2}\frac{r^{2}}{a^{2}}\left(\alpha^{2}\frac{r^{2}}{a^{2}} - \frac{r'^{2}}{a'^{2}}\right)\right] - \frac{1}{2}\left(\frac{a'}{\triangle}\right)^{3}\alpha^{2}\frac{r^{2}}{a^{2}} + \frac{1}{8}\left(\frac{a'}{\triangle}\right)^{3}\left(\alpha^{2}\frac{r^{2}}{a^{2}} - \frac{r'^{2}}{a'^{2}}\right) - \frac{1}{8}\frac{a'}{\triangle} - \frac{a'r'}{r^{2}}H\right\}$$

To save labor, it must be remembered that

$$\left(\frac{\mathbf{a}'}{\triangle}\right)^5 \left(\alpha^2 \frac{r^2}{\mathbf{a}^2} - \frac{r'^2}{\mathbf{a}'^2}\right)^2$$
 and  $\left(\frac{\mathbf{a}'}{\triangle}\right) \left(\alpha \frac{r^2}{\mathbf{a}^2} - \frac{r'^2}{\mathbf{a}'^2}\right)$ 

have been computed in our work on the second-order terms, and that

$$\left(\frac{\mathbf{a}'}{\triangle}\right)^3 \left(\alpha^2 \frac{r^2}{\mathbf{a}^2} - \frac{r'^2}{\mathbf{a}'^2}\right), \quad \left(\frac{\mathbf{a}'}{\triangle}\right)^3 \alpha^2 \frac{r^2}{\mathbf{a}^2}, \quad \left(\frac{\mathbf{a}'}{\triangle}\right)^3 \frac{r'^2}{\mathbf{a}'^2}, \quad \frac{\mathbf{a}'}{\triangle}, \quad \frac{\mathbf{a}'r}{r'^2} \mathbf{H}, \text{ and } \frac{\mathbf{a}'r'}{r^2} \mathbf{H}$$

have been computed for the first-order terms.

In the second place, derive Y and Y' from the equations

$$\mathbf{Y} = \mathbf{M} \frac{d}{dg} \left( a_0 r \frac{d\Omega}{dr} \right) + \mathbf{N} a_0 \left( r \frac{d}{dr} \right)^2 \Omega$$

$$\mathbf{Y'} = \mathbf{M'} \frac{d}{dg'} \left( a_0' r' \frac{d\Omega'}{dr'} \right) + \mathbf{N'} a_0' \left( r' \frac{d}{dr'} \right)^2 \Omega'$$

M, N, M', and N' have been used in deriving the quantities denoted X and X' in the second-order terms. Also,  $\frac{d}{dg}\left(a_0r\frac{d\Omega}{dr}\right)$ , etc., have already been obtained in computing V and V' in the second-order terms.

Then

$$r^{2}\frac{d^{2}\mathbf{T}}{dr^{2}} = \mathcal{A}\frac{d}{dg}\left[a_{0}\left(r\frac{d}{dr}\right)^{2}\Omega\right] + Ba_{0}\left(r\frac{d}{dr}\right)^{3}\Omega - \mathbf{B} - \mathbf{X} + 2\mathbf{Y}$$

$$r'^{2}\frac{d^{2}\mathbf{T}'}{dr^{2}} = \mathcal{A}'\frac{d}{dg'}\left[a_{0}'\left(r'\frac{d}{dr'}\right)^{2}\Omega'\right] + B'a_{0}'\left(r'\frac{d}{dr'}\right)^{3}\Omega' - \mathbf{B}' - \mathbf{X}' + 2\mathbf{Y}'$$

We have already used

$$a_0 \left(r \frac{d}{dr}\right)^2 \Omega$$
 and  $a_0' \left(r' \frac{d}{dr'}\right)^2 \Omega'$ 

in computing V and V'. The quantities, for the sake of distinction, denoted A, B, A', and B' are the same as A, B, A', and B' in the formulæ of the first-order terms

$$\mathbf{T} = \mathbf{A} a_0 \frac{d\Omega}{dg} + \mathbf{B} a_0 r \frac{d\Omega}{dr}$$
 $\mathbf{T}' = \mathbf{A}' a_0' \frac{d\Omega'}{dg'} + \mathbf{B}' a_0 r' \frac{d\Omega'}{dr'}$ 

After  $r^2 \frac{d^2 \mathbf{T}}{dr^2}$  and  $r'^2 \frac{d^2 \mathbf{T'}}{dr'^2}$  have been obtained, we get the four remaining factors from the equations

$$r^{2}\frac{d^{2}T}{dr'^{2}} + rr'\frac{d^{2}T}{drdr'} = -2B - X + Y$$

$$rr'\frac{d^{2}T}{drdr'} + r'^{2}\frac{d^{2}T}{dr'^{2}} = -2G - X - Y$$

$$r'^{2}\frac{d^{2}T'}{dr'^{2}} + rr'\frac{d^{2}T'}{drdr'} = -2B' - X' + Y'$$

$$rr'\frac{d^{2}T}{drdr'} + r^{2}\frac{d^{2}T'}{drdr'} = -2G' - X' - Y'$$

These equations result very simply from the consideration that T and T' are homogeneous functions of r and r'.

If, then, we make the two following multiplications, viz.,

$$\left(\frac{\mathbf{a}'}{\triangle}\right)^7 \text{ by } \frac{15}{8} \left(\frac{\mathbf{r}'^2}{\mathbf{a}'^2} - \alpha^2 \frac{\mathbf{r}^2}{\mathbf{a}^3}\right)^8$$
$$\left(\alpha^2 \frac{\mathbf{r}^2}{\mathbf{a}^2} - \frac{\mathbf{r}'^2}{\mathbf{a}'^2}\right) \left(\frac{\mathbf{a}'}{\triangle}\right)^5 \text{ by } -\frac{9}{2} \alpha^2 \frac{\mathbf{r}^2}{\mathbf{a}^3}$$

we shall be able, by the aid of the products, together with expressions previously obtained, to get the quantities  $a_0 \left(r \frac{d}{dr}\right)^3 \Omega$  and  $a_0' \left(r' \frac{d}{dr'}\right)^3 \Omega'$ , and that through simple additions or subtractions.

By raising the value of  $\frac{r'^2}{a'^2} - \alpha^2 \frac{r^2}{a}$ , given on page 201, to the third power, we have

$$\frac{15}{8} \left( \frac{r'^2}{a^{'2}} - \alpha^2 \frac{r^2}{a^2} \right)^3 = [9.83735] - 2[9.19885] \cos g' + 2[8.0107] \cos 2g' - 2[5.61] \cos 3g' + 2[8.6105] \cos g + 2[7.1181] \cos 2g + 2[5.57] \cos 3g' + 2[7.8045] \cos (g' - g) - 2[7.8045] \cos (g' + g) - 2[6.1481] \cos (g' - 2g) - 2[6.1481] \cos (g' + 2g) + 2[6.2142] \cos (2g' - g) + 2[6.2142] \cos (2g' + g)$$

Also

$$-\frac{9}{2}\alpha^2 \frac{r^2}{a^2} = -\left[0.12783\right] + 2\left[8.8096\right]\cos g + 2\left[6.89\right]\cos 2g$$

## The derived products are:

| Arg=i'g'+ig | $\frac{15}{8} \left(\frac{\mathbf{a}'}{\Delta}\right)^7 \left(\frac{\mathbf{r}'^3}{\mathbf{a}'^3} - \alpha^2 \frac{\mathbf{r}^3}{\mathbf{a}^2}\right)^3 \qquad \qquad \frac{9}{8} \left(\frac{\mathbf{a}'}{\Delta}\right)^5 \left(\frac{\mathbf{r}'^3}{\mathbf{a}'^2} - \alpha^2 \frac{\mathbf{r}^3}{\mathbf{a}^2}\right) \alpha^2 \frac{\mathbf{r}^4}{\mathbf{a}^3}$ |                 | $\alpha^2 \frac{\tau^2}{\mathbf{a}^2} \alpha^2 \frac{\tau^2}{\mathbf{a}^2}$ |          |

We have in the next place to attend to the following factors of  $\delta^2 T$  and  $\delta^2 T'$ . As the multiplications by which these quantities are formed naturally divide themselves into three sections independent of each other, according as the terms produced are independent of the factors nt or n't, or involve the first power of these factors, or in the last place their squares, we will divide the consideration of the second factors of  $\delta^2 T$  and  $\delta^2 T'$  into corresponding portions.

Of these fourteen factors four, viz.,  $n\delta^2 z$ ,  $n'\delta^2 z'$ ,  $\delta \nu$ ,  $\delta \nu'$ , have already been given; but from  $\delta \nu$  and  $\delta \nu'$  must be subtracted the constants which have virtually been supposed to belong to these quantities in Chapter I, when we derived the value of  $\alpha$ . Now, from the present investigation, it appears that the value +1''.622 of the constant term of l(r'), given by Hansen,\* is six times too large. Thus it is necessary to attribute to the constant terms of  $\delta \nu$  and  $\delta \nu'$  severally the values +0''.0665 and -1''.387.

<sup>\*</sup> Gegenseitige Störungen des Jupiter und Saturn, s. 167.

We have next to form the ten squares and products of the four quantities  $n\delta z$ ,  $n'\delta z'$ ,  $\nu$ , and  $\nu'$ . In doing this it will be more accurate to employ for  $n\delta z$ ,  $n'\delta z'$ , etc., not their values, as given by considering first-order terms only, but as they are after  $n\delta^2 z$ ,  $n'\delta^2 z'$ , etc., have been added to them. In this connection it is plain that the values, which ought to be attributed to the constant terms of  $\nu$  and  $\nu'$ , are the same as those just given in the case of  $\delta \nu$  and  $\delta \nu'$ . It is convenient to give these squares and products the factor  $\frac{1}{2}''(\log \pm 4.38454)$ , as, on multiplication by the first factor of  $\delta^2 T$  or  $\delta^2 T'$ , the resulting product is in seconds of arc as we desire it.

The following tables contain the developments of the portions of these squares and products which are independent of the factors nt or n't or their powers. The coefficients are uniformally carried to nine places of decimals; and the decimal point is omitted:

| Arg=   | $(n\delta z)$   | $\frac{1}{2}$ $\times \frac{1}{2}$   | $(n\delta z)(n$   | $(\delta z') \times \frac{\mathbf{I}''}{2}$  | $(n'\delta z')$   | $()^2 \times \frac{1}{2}^{\prime\prime}$  | $(n\delta z)$  | $\nu \times \frac{1}{2}^{\prime\prime}$   | $(n'\delta z')$   | $\nu \times \frac{I''}{2}$  |

We are now in possession of all the quantities needed for the calculation of the portions of  $\delta^2 T$  and  $\delta^2 T'$  which are not multiplied by the factors nt, n't or their powers. Hence, proposing to stop the approximation with the terms of three dimensions, we avail ourselves of the possibility of obtaining a higher degree of precision by computing the terms of these quantities which depend severally on the arguments  $\gamma$  and  $\gamma'$ , and applying the resulting corrections to  $n\delta z$ ,  $n\delta^2 z$ ,  $\nu$ ,  $\delta \nu$ ,  $n'\delta z'$ ,  $n'\delta^2 z'$ ,  $\nu'$ , and  $\delta \nu'$ . This course of proceeding is exactly similar to that we employed with the second-order terms in Chapter IX

There has been found .

$$δ2T = -0.0038635 sin (-γ) + 0.0080094 cos (-γ)$$
 $δ2T' = +0.100156 sin γ' -0.059616 cos γ'$ 

On integration these equations give

$$n\delta^3 z = -0.0080094nt \sin(-g) - 0.0038635nt \cos(-g)$$
  

$$n'\delta^3 z' = -0.059616n't \sin g' - 0.100156n't \cos g'$$

If these corrections are applied to the complete values of  $n\delta z$  and  $n'\delta z'$ , obtained previously, we get

$$n\delta z = -1.284368nt \sin(-g) - 1.400329nt \cos(-g)$$
  
 $n'\delta z' = -6.681432n't \sin g' - 10.708152n't \cos g'$ 

The values used in the computation of the third-order terms, however, were

```
n\delta z = -1.284370nt \sin(-g) - 1.400324nt \cos(-g)
       -0.015494nt \sin (-2g) - 0.016877nt \cos (-2g)
       -0.000373nt \sin(-3g) - 0.000407nt \cos(-3g)
       -0.000012nt \sin (-4g) - 0.000013nt \cos (-4g)
   \nu = - 0.015507nt
       -0.642311nt \cos(-g) + 0.700126nt \sin(-g)
       -0.015490nt\cos(-2g) + 0.016872nt\sin(-2g)
       -0.000557nt\cos(-3g) + 0.000612nt\sin(-3g)
n'\delta z' = -6.681439n't \sin g' - 10.708170n't \cos g'
       -0.092997n't \sin 2g' - 0.149736n't \cos 2g'
       -0.002549n't \sin 3g'
                              - 0.004189n't \cos 3g'
       -0.000094n't \sin 4g' - 0.000158n't \cos 4g'
   \nu' = + 0.093349n't
       +3.339074n't \cos g' - 5.352962n't \sin g'
       + 0.092870n't \cos 2g' - 0.149869n't \sin 2g'
       + 0.003852n't \cos 3g'
                              - 0.006330n't \sin 3g'
       + 0.000191n't \cos 4g' - 0.000319n't \sin 4g'
```

In order to have the proper values of  $n\delta^2 z$ ,  $n'\delta^2 z'$ ,  $\delta \nu$ , and  $\delta \nu'$  the values employed for  $n\delta z$ ,  $n'\delta z'$   $\nu$ , and  $\nu'$  in computing the second-order terms ought to be subtracted from those just given. With regard to  $n\delta z$  and  $\nu$  the values were not quite the same in computing  $\delta T'$  as in computing  $\delta T$ . Hence, in deriving  $\delta^2 T$  we employ the terms

$$n\delta^{2}z = -0.008457nt \sin(-g) - 0.004104nt \cos(-g)$$

$$-0.000116nt \sin(-2g) - 0.000046nt \cos(-2g)$$

$$-0.00002nt \sin(-3g) - 0.00001nt \cos(-3g)$$

$$\delta v = -0.000105nt$$

$$-0.004354nt \cos(-g) + 0.002016nt \sin(-g)$$

$$-0.000112nt \cos(-2g) + 0.000041nt \sin(-2g)$$

```
n'\delta^2 z' = -0.069141n't \sin g' - 0.115525n't \cos g'
-0.000416n't \sin 2g' - 0.001386n't \cos 2g'
+0.000044n't \sin 3g' - 0.000034n't \cos 3g'
\delta \nu' = +0.000574n't
+0.032925n't \cos g' - 0.056640n't \sin g'
+0.000289n't \cos 2g' - 0.001519n't \sin 2g'
-0.000037n't \cos 3g' - 0.000098n't \sin 3g'
```

But in deriving  $\delta^2 T'$  we substitute for the first two the following:

```
n\delta^{2}z = -0.008008nt \sin(-g) - 0.003859nt \cos(-g)
-0.00097nt \sin(-2g) - 0.000047nt \cos(-2g)
-0.00002nt \sin(-3g) - 0.00001nt \cos(-3g)
\delta\nu = -0.00097nt
-0.004004nt \cos(-g) + 0.001930nt \sin(-g)
-0.00097nt \cos(-2g) + 0.000047nt \sin(-2g)
-0.00003nt \cos(-3g) + 0.00002nt \sin(-3g)
```

The remaining terms of these quantities are the same as those given at pages 290-294, 335-339. In computing  $\delta T$  it is convenient to have n always accompany t as a factor, and with  $\delta T'$  to have n' accompany the same variable. Hence, we take occasion to make some multiplications by  $\frac{n'}{n}$ ,  $\frac{n'^2}{n^2}$  or the reciprocals of these factors.

The following tables contain the portions of the ten factors which are multiplied by nt or n't. The coefficients are expressed in units of the eleventh decimal:

| Arg=<br>i'g'+ig                                  | $(n\delta z)^2 \times \frac{1}{2}^{\prime\prime}$ |   | $(n\delta z)(n'\delta z')\times \frac{1}{2}^{"}$            |                                     | $(n'\delta z')$  | $(n'\delta z')^3 \times \frac{1}{2}^{"}$               |   | $\nu \times \frac{\mathfrak{l}''}{2}$  | $(n'\delta z')\nu \times \frac{1}{2}''$          |  |

In like manner the portions of the ten factors multiplied by  $n^2t^2$  or  $n'^2t^2$  follow; the coefficients are expressed in units of the thirteenth decimal when multiplied by  $n^2t^2$ , but in units of the twelfth decimal when multiplied by  $n'^2t^2$ :

## CHAPTER XVIII.

THIRD-ORDER PERTURBATIONS OF THE MEAN ANOMALY AND RADIUS-VECTOR OF JUPITER ARISING FROM THE MUTUAL ACTION OF THIS PLANET AND SATURN.

The summation of the fourteen parts of  $\delta^2T$ , given in the preceding chapter, produces the following expression:

| A    | rg=             |            |            | $\delta^2 { m T}$ |                  | ·             |            |

In precisely the same manner as  $\overline{W_0}$  and  $\overline{\delta W_0}$  have, in preceding chapters, been derived from T and  $\delta$ T we now get  $\overline{\delta^2 W_0}$  from  $\delta^2$ T. In the case of the terms depending on the arguments 5g'-2g and 1Qg'-4g the motion of the argument has been equated. We proceed as at page 275, the only difference being that here terms multiplied by  $n^2t^2$  are present. By adding T,  $\delta$ T, and  $\delta^2$ T we obtain

```
\mathbf{T} + \delta \mathbf{T} + \delta^2 \mathbf{T} = \begin{bmatrix} -0.0718628 - 0.000139010nt + 0.00000003466n^2t^2 \end{bmatrix} \sin(5g' - 2g) \\ + [-0.1794415 + 0.000082567nt + 0.00000004538n^2t^2] \cos(5g' - 2g) \\ + [-0.0051553 + 0.000008603nt + 0.0000000188n^2t^2] \sin(10g' - 4g) \\ + [-0.0052333 + 0.000006509nt - 0.0000000379n^2t^2] \cos(10g' - 4g) \end{bmatrix}
```

In the case of the argument 5g'-2g we get  $\kappa$  and the corrected integrating factor from

$$\log n = 6.9171965n$$
  $\log \mu = 1.8995167$ 

In the case of the argument 10g'-4g the similar quantities are

$$\log \mu = 7.16317n$$
  $\log \mu = 1.59510$ 

The expression just written can then be transformed into

```
[-0.0718628 + 0.00009283nt - 0.0000000903n^2t^2] \sin (5g' - 2g + \kappa nt) + [-0.1794415 + 0.000023179nt - 0.00000000823n^2t^2] \cos (5g' - 2g + \kappa nt) + [-0.0051553 + 0.00000983nt - 0.0000000214n^2t^2] \sin (10g' - 4g + \kappa nt) + [-0.0052333 - 0.00000997nt + 0.00000000319n^2t^2] \cos (10g' - 4g + \kappa nt)
```

Integrating this the result is

```
\begin{aligned} \mathbf{W}_0 + \delta \mathbf{W}_0 + \delta^2 \mathbf{W}_0 &= \begin{bmatrix} 5.83882 - 0.0008402nt + 0.000000716n^2t^2 \end{bmatrix} \cos \left( 5g' - 2g + \kappa nt \right) \\ + \left[ -14.17103 + 0.0017254nt - 0.000000653n^2t^2 \right] \sin \left( 5g' - 2g + \kappa nt \right) \\ + \left[ 0.20113 - 0.00002881nt + 0.0000000842n^2t^2 \right] \cos \left( 10g' - 4g + \kappa nt \right) \\ + \left[ 0.20714 - 0.00004586nt + 0.0000001256n^2t^2 \right] \sin \left( 10g' - 4g + \kappa nt \right) \\ &= \begin{bmatrix} 5.83882 + 0.0108709nt - 0.000002704n^2t^2 \end{bmatrix} \cos \left( 5g' - 2g \right) \\ + \left[ -14.17103 + 0.0065507nt + 0.000003492n^2t^2 \right] \sin \left( 5g' - 2g \right) \\ + \left[ 0.20113 - 0.00033041nt - 0.000000622n^2t^2 \right] \cos \left( 10g' - 4g \right) \\ + \left[ 0.20714 + 0.00024699nt - 0.0000001360n^2t^2 \right] \sin \left( 10g' - 4g \right) \end{aligned}
```

If from the latter expression we subtract the following (obtained at page 276)

$$W_0 + \delta W_0 = \begin{cases} 5.92153 + 0.0107729nt \end{cases} \cos (5g' - 2g) \\ + \{-14.29576 + 0.0068379nt \} \sin (5g' - 2g) \\ + [0.16574 + 0.00004901nt] \cos (10g' - 4g) \\ + [0.17595 - 0.00003718nt] \sin (10g' - 4g) \end{cases}$$

we get

$$\delta^{2}W_{0} = \begin{bmatrix} -0.08271 + 0.0000980nt & -0.000002704n^{2}t^{2} \end{bmatrix} \cos(5g' - 2g) \\ + \begin{bmatrix} 0.12473 - 0.0002872nt & +0.000003492n^{2}t^{2} \end{bmatrix} \sin(5g' - 2g) \\ + \begin{bmatrix} 0.03539 - 0.00037942nt - 0.0000000622n^{2}t^{2} \end{bmatrix} \cos(10g' - 4g) \\ + \begin{bmatrix} 0.03119 + 0.00028417nt - 0.0000001360n^{2}t^{2} \end{bmatrix} \sin(10g' - 4g) \end{bmatrix}$$

The value of  $\overline{\delta^2 W_0}$  follows:

| $\begin{array}{c ccccccccccccccccccccccccccccccccccc$         | rg=i'g'+ig   |                       |                                | $\overline{\delta^2 W_0}$ |                |               |               |

The rigorous equation determining z is

$$\frac{dz}{dt} = \mathbf{I} + \frac{\overline{\mathbf{W}} + \mathbf{v}^2}{\mathbf{I} - \mathbf{v}^2}$$

where for  $\overline{W}$  we ought to substitute

$$\overline{W} = \overline{W_0} + \left(\frac{\overline{dW_0}}{d\gamma}\right) n \delta z + \frac{1}{2} \left(\frac{\overline{d^2W_0}}{d\gamma^2}\right) (n \delta z)^2 + \dots$$

Here the several factors include terms of all dimensions with respect to the disturbing forces. Limiting ourselves to the terms of three dimensions we have

$$\frac{d(n\delta^3z)}{ndt} = \overline{\delta^2 \overline{\mathbf{W}_0}} + \left(\frac{\overline{d}\overline{\mathbf{W}_0}}{d\gamma}\right) n\delta^2z + \left(\frac{\overline{d}\cdot \delta \overline{\mathbf{W}_0}}{d\gamma}\right) n\delta z + \frac{\mathbf{1}}{2} \left(\frac{\overline{d^2 \overline{\mathbf{W}_0}}}{d\gamma^2}\right) (n\delta z)^2 + 2\nu\delta\nu + \nu^2 \frac{d\cdot n\delta z}{ndt}$$

All the factors involved in the right member of this equation have already been given. But, as in forming the product  $\left(\frac{\overline{dW_0}}{\overline{dy}}\right)n\delta z$  in the computation of the terms of the second order, we have corrected the two factors for the terms multiplied by nt, belonging to the arguments g, 2g, etc., and which result from the previous computation of  $\delta W_0$ , these terms must be omitted from the factors  $n\delta^2 z$  and  $\left(\frac{\overline{d} \cdot \delta W_0}{\overline{dy}}\right)$ .

The values of the five additional quantities involved in the expression of  $\frac{d(n\delta^3z)}{ndt}$  follow:

| Arg=i'g'+ig  | $\Big(\overline{\frac{d\overline{W_0}}{d\gamma}}\Big) n\delta^2 z$ |                |                |                |               |            |

The single sensible term of  $\frac{d \cdot \delta z}{dt}v^2$  is +0''.004nt.

The addition of the six terms of  $\frac{d \cdot \delta^3 z}{dt}$  gives the following expression for this quantity:

| Arg=i'g'+ig  |                     | $rac{d \; . \; \delta^{ eta z}}{dt}$ |               |                  |               |               |  |  |

|                | $n^3t^3$ cos.           | $n^3t^3$ sin.                   |  |  |  |  |
| i' i O— I O— 2 |                         | +0.00000000181<br>+0.0000000004 |  |  |  |  |

On integrating this expression we arrive at  $n\delta^3z$ . In order to make the terms depending on the argument g disappear it is necessary to put  $k_1 = -0''.0339$  and  $k_2 = -0''.0759$ . In the case of the terms involving the arguments 5g' - 2g and 10g' - 4g we equate the motions of the latter. By adding the values which have been obtained for  $\frac{d \cdot n\delta z}{ndt}$ , and  $\frac{d \cdot n\delta^3 z}{ndt}$  we get, taking the liberty of calling the sum  $\frac{d \cdot n\delta z}{ndt}$ ,

$$\frac{d \cdot n\delta z}{ndt} = \begin{bmatrix} \frac{77}{5.80177} + 0.0100762nt - 0.000002149n^2t^2 \end{bmatrix} \cos(5g' - 2g) \\ + \begin{bmatrix} -14.01188 + 0.0056567nt + 0.000003088n^2t^2 \end{bmatrix} \sin(5g' - 2g) \\ + \begin{bmatrix} 0.19539 - 0.0003068nt - 0.00000062n^2t^2 \end{bmatrix} \cos(10g' - 4g) \\ + \begin{bmatrix} 0.20289 + 0.0002363nt - 0.000000138n^2t^2 \end{bmatrix} \sin(10g' - 4g) \end{bmatrix}$$

For this expression may be substituted

$$\frac{d \cdot n\delta z}{dt} = \begin{bmatrix} \frac{\pi}{5.80177} - 0.0005247nt + 0.000000471n^2t^2 \end{bmatrix} \cos(5g' - 2g + \kappa nt) \\ + [-14.01188 + 0.0012673nt - 0.000000525n^2t^2] \sin(5g' - 2g + \kappa nt) \\ + [0.19539 - 0.0000296nt + 0.000000079n^2t^2] \cos(10g' - 4g + \kappa nt) \\ + [0.20289 - 0.0000307nt + 0.000000092n^2t^2] \sin(10g' - 4g + \kappa nt) \end{bmatrix}$$

where, in the case of 5g'-2g,  $\kappa$  and the corrected integrating factor are determined by

$$\log \mu = 6.8788474n$$
  $\log \mu = 1.8971166$ 

and, in the case of 10g'-4g, by

$$\log \mu = 7.13560n$$
  $\log \mu = 1.59358$ 

Integrating the last expression we obtain

$$n\delta z = \begin{bmatrix} \frac{1}{2} & \frac{1}{2} & \frac{1}{2} \\ \frac{1}{2} & \frac{1}{2} \\ \frac{1}{2} & \frac{1}{2} & \frac{1}{2} \\ \frac{1}{2} & \frac{1}{2} & \frac{1}{2} \\ \frac{1}{2} & \frac{1}{2} & \frac{1}{2} \\ \frac{1}{2} & \frac{1}{2} & \frac{1}{2} \\ \frac{1}{2} & \frac{1}{2} & \frac{1}{2} \\ \frac{1}{2} & \frac{1}{2} & \frac{1}{2} \\ \frac{1}{2} & \frac{1}{2} & \frac{1}{2} \\ \frac{1}{2} & \frac{1}{2} & \frac{1}{2} \\ \frac{1}{2} & \frac{1}{2} & \frac{1}{2} \\ \frac{1}{2} & \frac{1}{2} & \frac{1}{2} \\ \frac{1}{2} & \frac{1}{2} \\ \frac{1}{2} & \frac{1}{2} \\ \frac{1}{2} & \frac{1}{2} \\ \frac{1}{$$

By developing this expression and subtracting therefrom the value of  $n\delta z + n\delta^2 z$  we should have  $n\delta^3 z$ ; but as this quantity has no particular interest we omit its derivation, and in the following value of  $n\delta^3 z$  the terms corresponding to the arguments 5g' - 2g and 10g' - 4g are not given.

In writing a final form for the great inequality of Jupiter, we prefer to still further equate the motions of the arguments, so that the sum of the squares of the multipliers of nt in the coefficients may be a minimum. This gives, severally, in the cases of 5g'-2g and 10g'-4g

$$\log n = 6.8752079n$$
  $\log n = 7.12506n$ 

and the final form of  $n\delta z$  will be

$$n\delta z = \begin{bmatrix} 1196.045 & -0.105371nt \end{bmatrix} \sin \left( 5g' - 2g + \kappa nt + 67 & 6 & 33.71 \right) \\ + & 0.00005546n^2t^2 & \sin \left( 5g' - 2g + \kappa nt + 48 & 46 & 1 \right) \\ + \begin{bmatrix} 11.0349 & -0.001654nt \end{bmatrix} \sin \left( 10g' - 4g + \kappa nt + 313 & 35.1 & 1 \right) \\ + & 0.0000477n^2t^2 & \sin \left( 10g' - 4g + \kappa nt + 311 & 21 & 1 \right) \end{bmatrix}$$

The great inequality excepted, the expression of  $n\delta^3 z$  follows. The proper number of decimals is restored to the factors of nt and  $n^2t^2$ :

|                | <u> </u>  |   |

As it is not necessary for practical purposes that the radius-vector should be known to the same degree of accuracy as the longitude and latitude, we might neglect all the terms of three dimensions in it; but as it is extremely easy to derive from  $\delta^2 W_0$  the portion of  $\delta^2 \nu$  which depends on it, and the remaining portion is probably of considerably less importance, this quantity has been derived from the equation

$$\delta^2 
u = -rac{\mathrm{I}}{2} \int \left( rac{\overline{d \cdot \delta^2 W_0}}{d 
u} 
ight) n dt$$

It is thought unnecessary to go to the labor of deriving the constant term, probably very small. Also the two terms factored severally by nt and  $n^2t^2$  and independent of g and g' have been obtained by multiplying the similar terms having the argument -g by a factor whose logarithm is 8.3828:

## CHAPTER XX.

THIRD-ORDER PERTURBATIONS OF THE MEAN ANOMALY AND RADIUS-VECTOR OF SATURN ARISING FROM THE MUTUAL ACTION OF THIS PLANET AND JUPITER.

The summation of the fourteen parts of  $\delta^2T'$ , given in the preceding chapter, produces the following expression:

| Arg           | ·          |                  |                   | $\delta^2 \mathrm{T}'$ |                       |                |                         |
|---------------|------------|------------------|-------------------|------------------------|-----------------------|----------------|-------------------------|

In precisely the same manner as  $\overline{W_0}'$  and  $\overline{\delta W_0}'$  have, in preceding chapters, been derived from T' and  $\delta T'$  we now get  $\overline{\delta^2 W_0}'$  from  $\delta^2 T'$ . In the case of the terms depending on the arguments 5g'-2g and 10g'-4g the motion of the argument has been equated. By adding T',  $\delta T'$ , and  $\delta^2 T'$  we obtain

```
\mathbf{T}' + \delta \mathbf{T}' + \delta^2 \mathbf{T}' = \begin{bmatrix} 1.1238805 + 0.004092190n't - 0.0000019944n'^2t^2 \end{bmatrix} \sin(5g' - 2g) 
+ \begin{bmatrix} 2.7810935 - 0.002383674n't - 0.0000027721n'^2t^2 \end{bmatrix} \cos(5g' - 2g) 
+ \begin{bmatrix} 0.0796974 - 0.00029408n't - 0.0000001310n'^2t^2 \end{bmatrix} \sin(10g' - 4g) 
+ \begin{bmatrix} -0.0812486 - 0.00022188n't + 0.0000002400n'^2t^2 \end{bmatrix} \cos(10g' - 4g)
```

In the case of the argument 5g'-2g we get  $\kappa$  and the corrected integrating factor from

$$\log \mu = 7.1938508n \qquad \log \mu = 1.4977415$$

In the case of the argument 10g' - 4g the similar quantities are

$$\log \mu = 7.50649n$$
  $\log \mu = 1.1972902$ 

The expression just written can then be transformed into

```
[1.1238805 - 0.000253577n't + 0.0000003582n'^2t^2] \sin (5g' - 2g + \kappa n't) + [2.7810935 - 0.000627487n't + 0.0000002271n'^2t^2] \cos (5g' - 2g + \kappa n't) + [0.0796974 - 0.00003328n't + 0.000001706n'^2t^2] \sin (10g' - 4g + \kappa n't) + [-0.0812486 + 0.00003394n't - 0.0000002854n'^2t^2] \cos (10g' - 4g + \kappa n't)
```

Integrating this the result is

```
\begin{aligned} \mathbf{W}_{0}' + \delta \mathbf{W}_{0}' + \delta^{2} \mathbf{W}_{0}' &= \begin{bmatrix} -35.95457 + 0.00842664n't - 0.000011267n'^{2}t^{2} \end{bmatrix} \cos \left( 5g' - 2g + \varkappa n't \right) \\ + \begin{bmatrix} 87.22464 - 0.01903107n't + 0.000007143n'^{2}t^{2} \end{bmatrix} \sin \left( 5g' - 2g + \varkappa n't \right) \\ + \begin{bmatrix} -1.24551 + 0.0003825n't - 0.000002687n'^{2}t^{2} \end{bmatrix} \cos \left( 10g' - 4g + \varkappa n't \right) \\ + \begin{bmatrix} -1.28572 + 0.0006191n't - 0.000004495n'^{2}t^{2} \end{bmatrix} \sin \left( 10g' - 4g + \varkappa n't \right) \\ &= \begin{bmatrix} -35.95457 - 0.1278715n't + 0.000062367n'^{2}t^{2} \end{bmatrix} \cos \left( 5g' - 2g \right) \\ + \begin{bmatrix} 87.22464 - 0.0752141n't - 0.000061743n'^{2}t^{2} \end{bmatrix} \sin \left( 5g' - 2g \right) \\ + \begin{bmatrix} -1.24551 + 0.0045096n't + 0.000001743n'^{2}t^{2} \end{bmatrix} \cos \left( 10g' - 4g \right) \\ + \begin{bmatrix} -1.28572 - 0.0033789n't + 0.000003357n'^{2}t^{2} \end{bmatrix} \sin \left( 10g' - 4g \right) \end{aligned}
```

If from the latter expression we subtract the following (obtained at page 319)

$$\mathbf{W}_{0}' + \delta \mathbf{W}_{0}' = \begin{bmatrix} -36.20315 - 0.1261798n't \end{bmatrix} \cos (5g' - 2g) \\ + \begin{bmatrix} 87.71763 - 0.0767907n't \end{bmatrix} \sin (5g' - 2g) \\ + \begin{bmatrix} -1.02918 - 0.0006600n't \end{bmatrix} \cos (10g' - 4g) \\ + \begin{bmatrix} -1.09555 + 0.0005106n't \end{bmatrix} \sin (10g' - 4g) \end{bmatrix}$$

we get

$$\delta^{2}W_{0}' = \begin{bmatrix} 0.24858 - 0.0016917n't + 0.000062367n'^{2}t^{2} \end{bmatrix} \cos(5g' - 2g) \\ + [-0.49299 + 0.0015766n't - 0.000086179n'^{2}t^{2}] \sin(5g' - 2g) \\ + [-0.21633 + 0.0051696n't + 0.000001743n'^{2}t^{2}] \cos(10g' - 4g) \\ + [-0.19017 - 0.0038895n't + 0.000003357n'^{2}t^{2}] \sin(10g' - 4g)$$

The value of  $\delta^{\overline{2}}\overline{W_{\mathfrak{g}}'}$  follows:

Similarly, as in the case of Jupiter, we have the equation

$$\frac{d \cdot \delta^3 z}{dt} = \overline{\delta^2 \mathbf{W_0}'} + \left( \overline{\frac{d \mathbf{W_0}'}{d \gamma'}} \right) n' \delta^2 z' + \left( \overline{\frac{d \cdot \delta \mathbf{W_0}'}{d \gamma'}} \right) n' \delta z' + \frac{\mathbf{1}}{2} \left( \overline{\frac{d^2 \mathbf{W_0}'}{d \gamma'^2}} \right) (n' \delta z')^2 + 2 \nu' \delta \nu' + \nu'^2 \frac{d \cdot \delta z'}{dt}$$

All the factors involved in the right member of this equation have already been given. But, as in forming the product  $\left(\frac{dW_0'}{d\gamma'}\right)n'\delta z'$ , in treating the terms of the second order, we have corrected the two factors for the terms multiplied by n't, belonging to the arguments g', 2g', etc., and which result from the previous computation of  $\delta W_0'$ , these terms must be omitted from the factors  $n'\delta^2 z'$  and  $\left(\frac{\overline{d \cdot \delta W_0'}}{d\gamma'}\right)$ .

The expressions of the five additional products involved in  $\frac{d \cdot \delta^3 z'}{dt}$  follow:

| Arg=i'g'+ig | $\Big(\overline{rac{d W_0'}{d \gamma'}}\Big) n' \delta^2 oldsymbol{z}'$ |                 |           |                |                     |                |  |  |

On integrating this expression we arrive at  $n'\delta^3z'$ . In order to make the terms depending on the argument g' disappear it is necessary to put  $k_1 = + o''.3287$  and  $k_2 = + o''.2339$ . In the case of the terms involving the arguments 5g' - 2g and 10g' - 4g we equate the motions of the latter. By adding the values which have been obtained for  $\frac{d \cdot \delta z'}{dt}$ ,  $\frac{d \cdot \delta^2 z'}{dt}$ , and  $\frac{d \cdot \delta^3 z'}{dt}$  we get, taking the liberty of calling the sum  $\frac{d \cdot \delta z'}{dt}$ ,

$$\frac{d \cdot \delta z'}{dt} = \begin{bmatrix} -35.06817 - 0.1504365n't + 0.000082766n'^2t^2 \end{bmatrix} \cos(5g' - 2g) + \begin{bmatrix} 84.57304 - 0.0853558n't - 0.000119767n'^2t^2 \end{bmatrix} \sin(5g' - 2g) + \begin{bmatrix} -1.17743 + 0.0047807n't + 0.000001551n'^2t^2 \end{bmatrix} \cos(10g' - 4g) + \begin{bmatrix} -1.22444 - 0.0035990n't + 0.0000379n'^2t^2 \end{bmatrix} \sin(10g' - 4g)$$

For this expression may be substituted

$$\frac{d \cdot \delta z'}{dt} = \begin{bmatrix} " & " & " & " \\ -35.06817 + 0.0081298n't - 0.000015631n'^2t^2 \end{bmatrix} \cos\left(5g' - 2g + \kappa n't\right) \\ + \begin{bmatrix} 84.57304 - 0.0196064n't + 0.000013638n'^2t^2 \end{bmatrix} \sin\left(5g' - 2g + \kappa n't\right) \\ + \begin{bmatrix} -1.17743 + 0.0004987n't - 0.000003835n'^2t^2 \end{bmatrix} \cos\left(10g' - 4g + \kappa n't\right) \\ + \begin{bmatrix} -1.22444 + 0.0005186n't - 0.000006152n'^2t^2 \end{bmatrix} \sin\left(10g' - 4g + \kappa n't\right) \end{bmatrix}$$

where, in the case of 5g'-2g,  $\kappa$  and the corrected integrating factor are determined by

$$\log \mu = 7.2729790n$$
  $\log \mu = 1.5020293$ 

and, in the case of 10g'-4g, by

$$\log \mu = 7.54371n$$
  $\log \mu = 1.1992594$ 

Integrating the last expression we obtain

$$n'\delta z' = \begin{bmatrix} -1132.9347 + 0.285824n't - 0.00049661n'^2t^2 \end{bmatrix} \sin(5g' - 2g + \kappa n't) + \begin{bmatrix} -2677.8791 + 0.591358n't - 0.00043329n'^2t^2 \end{bmatrix} \cos(5g' - 2g + \kappa n't) + \begin{bmatrix} -18.4689 + 0.004811n't - 0.00006067n'^2t^2 \end{bmatrix} \sin(10g' - 4g + \kappa n't) + \begin{bmatrix} 19.4491 - 0.010126n't + 0.00009734n'^2t^2 \end{bmatrix} \cos(10g' - 4g + \kappa n't)$$

By developing this expression and subtracting therefrom the value of  $n'\delta z' + n'\delta^2 z'$  we should have  $n'\delta^3 z'$ ; but as this quantity has no particular interest we omit its derivation, and in the following value of  $n'\delta^3 z'$  the terms corresponding to the arguments 5g'-2g and 10g'-4g are not given.

In writing a final form for the great inequality of Saturn, we prefer to still further equate the motions of the arguments, so that the sum of the squares of the multipliers of n't in the coefficients may be a minimum. This gives, severally, in the cases of 5g'-2g and 10g'-4g

$$\log x = 7.2703565n$$
  $\log x = 7.52728n$ 

and the final form of  $n'\delta z'$  will be

$$n'\delta z' = \begin{bmatrix} 2907.676 & -0.655990n't \end{bmatrix} \sin \left( 5g' - 2g + \kappa n't + 247 & 4 & 5.37 \right)$$

$$+ 0.00065602n'^2t^2 & \sin \left( 5g' - 2g + \kappa n't + 221 & 41 & 33 & \right)$$

$$+ \begin{bmatrix} 26.8211 - 0.010659n't \end{bmatrix} \sin \left( 10g' - 4g + \kappa n't + 133 & 31 & 9.3 & \right)$$

$$+ 0.00011466n'^2t^2 & \sin \left( 10g' - 4g + \kappa n't + 122 & 38 & \right)$$

The great inequality excepted, the expression of  $n'\delta^3z'$  follows. The proper number of decimals is restored to the factors of n't and  $n'^2t^2$ :

As in the case of Jupiter, for the general value of  $\delta^2 \nu'$ , we employ the formula

$$\delta^2 
u' = -rac{\mathrm{i}}{2} \int \left(rac{\overline{d \cdot \delta^2 \mathrm{W_0}'}}{d \gamma'}
ight) n' dt$$

But in the terms which involve the argument 5g'-2g it has been discovered that the complementary portion of the right member has a sensible value. Consequently, for this argument we make use of the complete formula

$$\frac{d\cdot\delta^2\nu'}{n'dt} = -\frac{1}{2}\left(\frac{\overline{d\cdot\delta^2W_0'}}{d\gamma'}\right) - \frac{1}{2}\left(\frac{\overline{d^2W_0'}}{d\gamma'^2}\right)n'\delta^2z' - \frac{1}{2}\left(\frac{\overline{d^2\cdot\delta W_0'}}{d\gamma'^2}\right)n'\delta z' - \frac{1}{4}\left(\frac{\overline{d^3W_0'}}{d\gamma'^3}\right)(n'\delta^2z')^2$$

The expressions for the factors involved in the right member have all been given, except those for  $-\frac{1}{2}\left(\frac{\overline{d^2\delta W_0'}}{d\gamma'^2}\right)$  and  $-\frac{1}{4}\left(\frac{\overline{d^3W_0'}}{d\gamma'^3}\right)$ . To a sufficient number of terms for our purpose the latter are:

| Arg=i'g'+ig                    | $-rac{1}{2}\Big(rac{ar{d}^2\delta \overline{\mathrm{W}_0}'}{d\gamma'^2}\Big)$ |  |   |                                      |  |                                  |

The multiplication being performed we get

$$-\frac{1}{2} \left( \frac{\overline{d^2 W_0'}}{d \gamma'^2} \right) n' \delta^2 z' = \begin{bmatrix} -0.14019 - 62.646n't + 4.472n'^2 t^2 \end{bmatrix} \sin \left( 5g' - 2g \right) \\ + \left[ -0.33710 + 36.383n't + 6.296n'^2 t^2 \right] \cos \left( 5g' - 2g \right) \\ -\frac{1}{2} \left( \frac{\overline{d^2 \delta W_0'}}{d \gamma'^2} \right) n' \delta z' = \begin{bmatrix} -0.00524 + 3.983n't - 5.024n'^2 t^2 \end{bmatrix} \sin \left( 5g' - 2g \right) \\ + \left[ -0.00824 - 0.989n't - 7.943n'^2 t^2 \right] \cos \left( 5g' - 2g \right) \\ -\frac{1}{4} \left( \frac{\overline{d^3 W_0'}}{d \gamma'^3} \right) (n' \delta z')^2 = \begin{bmatrix} -0.00277 - 0.189n't + 1.040n'^2 t^2 \end{bmatrix} \sin \left( 5g' - 2g \right) \\ + \left[ -0.00569 - 0.075n't + 2.563n'^2 t^2 \right] \cos \left( 5g' - 2g \right) \\ + \left[ -0.00569 - 0.075n't + 2.563n'^2 t^2 \right] \cos \left( 5g' - 2g \right) \\ + \left[ -0.00569 - 0.075n't + 2.563n'^2 t^2 \right] \cos \left( 5g' - 2g \right) \\ + \left[ -0.00569 - 0.075n't + 2.563n'^2 t^2 \right] \cos \left( 5g' - 2g \right) \\ + \left[ -0.00569 - 0.075n't + 2.563n'^2 t^2 \right] \cos \left( 5g' - 2g \right) \\ + \left[ -0.00569 - 0.075n't + 2.563n'^2 t^2 \right] \cos \left( 5g' - 2g \right) \\ + \left[ -0.00569 - 0.075n't + 2.563n'^2 t^2 \right] \cos \left( 5g' - 2g \right) \\ + \left[ -0.00569 - 0.075n't + 2.563n'^2 t^2 \right] \cos \left( 5g' - 2g \right) \\ + \left[ -0.00569 - 0.075n't + 2.563n'^2 t^2 \right] \cos \left( 5g' - 2g \right) \\ + \left[ -0.00569 - 0.075n't + 2.563n'^2 t^2 \right] \cos \left( 5g' - 2g \right) \\ + \left[ -0.00569 - 0.075n't + 2.563n'^2 t^2 \right] \cos \left( 5g' - 2g \right) \\ + \left[ -0.00569 - 0.075n't + 2.563n'^2 t^2 \right] \cos \left( 5g' - 2g \right)$$

If we add these three quantities to the corresponding terms of  $-\frac{1}{2}\left(\frac{d \cdot \delta^2 W_0'}{d\gamma'}\right)$  and  $\frac{d \cdot \delta^{\prime\prime}}{n'dt}$  and  $\frac{d \cdot \delta^{\prime\prime}}{n'dt}$  we get

$$\frac{d\nu'}{n'dt} = \begin{bmatrix} -0.76561 - 30.664n't + 2.022n'^2t^2 \end{bmatrix} \sin(5g' - 2g) + [-1.51056 + 19.032n't + 2.989n'^2t^2] \cos(5g' - 2g)$$

This expression may be changed to

$$\frac{d\nu'}{n'dt} = \begin{bmatrix} -0.76561 + 0.0001408n't - 0.000000293n'^2t^2 \end{bmatrix} \sin(5g' - 2g + \kappa n't) + [-1.51056 + 0.0002776n't - 0.000000117n'^2t^2] \cos(5g' - 2g + \kappa n't)$$

where the proper number of decimals has been restored to the coefficients of n't and  $n'^2t^2$ . The value of  $\varkappa$  and the corrected integrating factor are given by the equations

$$\log \mu = 7.32699$$
  $\log \mu = 1.5054687$ 

On integrating the last expression we obtain

$$\nu' = \begin{bmatrix} 24.7830 - 0.004750n't + 0.00000938n'^2t^2 \end{bmatrix} \cos(5g' - 2g + \kappa n't) + [-48.2213 + 0.008288n't - 0.00000375n'^2t^2] \sin(5g' - 2g + \kappa n't)$$

In order to put this in a final form we equate the argument still further, so that the sum of the squares of the coefficients of n't may be a minimum. This makes  $\log x = 7.32535$ , and we have the following expression

$$\nu' = [54.2171 - 0.009543n't] \quad \cos(5g' - 2g + \kappa n't + 62 \ 47 \ 58.0) + 0.00001005n'^2t^2 \cos(5g' - 2g + \kappa n't + 22 \ 9)$$

Omitting, then, the terms corresponding to the argument 5g'-2g the expression for  $\delta^2 \nu'$  follows. The proper number of decimals are restored to the coefficients of n't and  $n'^2t^2$ :

## CHAPTER XXI.

PERTURBATIONS OF SATURN OF THE SECOND ORDER FROM THE ACTION OF URANUS AND FACTORED BY n't.

Having now pushed the approximation to the perturbations of the longitudes and radii-vectors of Jupiter and Saturn, so far as these arise from their mutual action, to a sufficient length, it remains to consider certain terms of the second order, with respect to disturbing forces, which involve the mass of Uranus as a factor.

In the first place the perturbations of Saturn, due to the action of Uranus, which have been determined in Chapter III, are of the first order with respect to the disturbing force. The elements of both planets have been regarded as constant. In this chapter, then, we determine the additional terms which arise in the perturbations from attributing to these elements their augmentations proportional to the time. Here it will be sufficiently accurate to neglect the variations of the elements which determine the position of the planes of the orbits relative to each other. Also the effect on the latitude of Saturn may be neglected.

The more important part of the terms we wish to derive arises from the variation of the function T' (denoted as T at page 130; but here we propose to give one accent to quantities belonging to Saturn and two to those belonging to Uranus). To find the variation of T' we therefore employ the abbreviated formula

$$\delta \mathbf{T}' = \frac{d\mathbf{T}'}{dg'} n' \delta z' + \frac{d\mathbf{T}'}{dg''} n'' \delta z'' + r' \frac{d\mathbf{T}'}{dr'} \nu' + r'' \frac{d\mathbf{T}'}{dr''} \nu'' + \mathbf{C}' \delta \frac{h'}{h_0'}$$

in which the latter factors of the five terms may be limited to their secular terms. By joining together the terms of one, two, and three dimensions, obtained in the preceding chapters, we have for Saturn

$$n'\delta z' = - \left[ 0.82487 \right] n't \sin g' - \left[ 1.02971 \right] n't \cos g'$$

$$- \left[ 8.97104 \right] n't \sin 2g' - \left[ 9.17599 \right] n't \cos 2g'$$

$$- \left[ 7.4183 \right] n't \sin 3g' + \left[ 7.6233 \right] n't \cos 3g'$$

$$v' = \left[ 8.97195 \right] n't$$

$$+ \left[ 0.52384 \right] n't \cos g' - \left[ 0.72868 \right] n't \sin g'$$

$$+ \left[ 8.97104 \right] n't \cos 2g' - \left[ 9.17599 \right] n't \sin 2g'$$

$$+ \left[ 7.5944 \right] n't \cos 3g' - \left[ 7.7994 \right] n't \sin 3g'$$

$$\delta \frac{h'}{h_{n'}} = - \left[ 9.2730 \right] n't$$

The corresponding quantities for Uranus must be derived from the theory of this planet. Availing ourselves of Professor Newcomb's determinations,\* the unit of t being a Julian year, we have

$$\frac{de''}{dt} = - \circ''.\circ542\circ$$
  $\frac{d\pi''}{dt} = + 2''.846$ 

These data give

$$n''\delta z'' = - [9.70665]n't \sin g'' - [0.09803]n't \cos g''$$

$$- [7.7756]n't \sin 2g'' - [8.1671]n't \cos 2g''$$

$$- [6.1456]n't \sin 3g'' + [6.5370]n't \cos 3g''$$

$$r'' = [7.7764]n't$$

$$+ [9.40562]n't \cos g'' - [9.79700]n't \sin g''$$

$$+ [7.7756]n't \cos 2g'' - [8.1671]n't \sin 2g''$$

$$+ [6.3217]n't \cos 3g'' - [6.7131]n't \sin 3g''$$

The expressions for the factors  $\frac{dT'}{dg'}$  and  $\frac{dT'}{dg''}$  are readily derived by partial differentiation of the value of T', given in Chapter III (pages 130–133). It only remains to show how  $r'\frac{dT'}{dr'}$  and  $r''\frac{dT'}{dr''}$  are obtained. We have the formulæ

$$r' rac{d\mathbf{T}'}{dr'} = \mathbf{V}' + \mathbf{X}'$$
  $r'' rac{d\mathbf{T}'}{dr''} = -\mathbf{V}' - \mathbf{T}'$ 

where

$$\begin{split} \mathbf{V}' &= \mathbf{A}' \frac{d}{dg'} \bigg( \, a' r' \frac{d\Omega'}{dr'} \bigg) + \, \mathbf{B}' r' \frac{d}{dr'} \bigg( \, a' r' \frac{d\Omega'}{dr'} \bigg) \\ \mathbf{X}' &= \mathbf{M}' a' \frac{d\Omega'}{dg'} + \, \mathbf{N}' a r' \frac{d\Omega'}{dr'} \end{split}$$

The values of the factors involved in the right members of these equations have all been given, excepting that of  $\left(r'\frac{d}{dr'}\right)^2 a'\Omega'$ , A' and B' at page 74, M' and N' at page 212,  $a'\frac{d\Omega'}{dg'}$  and  $a'r'\frac{d\Omega'}{dr'}$  at pages 128–130. For the single remaining factor we have the equation

$$\left(r'\frac{d}{dr'}\right)^{2}a'\Omega' = \frac{3}{4}\mu\left(\frac{\mathbf{a}''}{\triangle}\right)^{5}\left[\frac{r''^{2}}{\mathbf{a}''^{2}} - \alpha^{2}\frac{r'^{2}}{\mathbf{a}'^{2}}\right]^{2} - \mu\left(\frac{\mathbf{a}''}{\triangle}\right)^{3}\left(\frac{r''}{\mathbf{a}''}\right)^{2} + \frac{\mathbf{I}}{4}\mu\frac{\mathbf{a}''}{\triangle} - (\mathbf{H})$$

The expressions for  $\frac{a''}{\triangle}$ ,  $\left(\frac{a''}{\triangle}\right)^3$ ,  $\left(\frac{a''}{\triangle}\right)^5$ ,  $\frac{r''^2}{a''^2}$ ,  $\alpha^2 \frac{r'^2}{a'^2}$ , and (H) have been given in Chapter III. We also readily get

$$\frac{3}{4} \left[ \frac{r''^2}{a''^2} - \alpha^2 \frac{r'^2}{a'^2} \right]^2 = [9.6346] - 2[8.7253] \cos g'' + 2[7.0120] \cos 2g'' + 2[8.1956] \cos g' + 2[6.5608] \cos 2g' - 2[6.9890] \cos (g'' - g') - 2[6.9890] \cos (g'' + g')$$

<sup>\*</sup>An Investigation of the Orbit of Uranus, pp. 80, 81. The only alteration made is the putting the mass of Neptune at 19 100 instead of 17 1000.

Making the single multiplication required and availing ourselves of all the data afforded in Chapter III we obtain the following expression:

| Arg=<br>i'g''+ig'  | $\frac{1}{\mu} \Big( r' \frac{d}{d\tau} \Big)$  | $a'\Omega'$  | $   \begin{array}{c}       \text{Arg} = \\       i'g'' + ig'   \end{array} $ | $\frac{1}{\mu} \left(r' \frac{d}{dr'}\right)^3 a' \Omega'$  |  |  | $\frac{1}{\mu} \left( r' \frac{d}{dr'} \right)$   | $a'\Omega'$   |

We next must obtain the terms of  $n'\delta^2z'$  and  $\delta\nu'$ , which undergo but one integration. These are given by the formulæ

$$\frac{\partial \cdot \delta^2 z'}{\partial t} = -2 \frac{\partial \nu'}{n' \partial t} n' \delta z' + \nu'^2$$

$$\frac{d \cdot \delta \nu'}{n'dt} = -\frac{1}{2} \left( \frac{\overline{d^2 W_0}'}{d \gamma'^2} \right) n' \delta z'$$

Employing the subscript  $\binom{m''}{m''}$  to denote the portions of the co-ordinates of Saturn proportional to the first power of the mass of Uranus, and which have been determined in Chapter III, the formulæ just given are expanded into

$$\frac{d \cdot \delta^2 z'}{dt} = \left(\frac{d\nu'}{n'dt}\right)_{n''} \times \text{secular terms of } -2n'\delta z'$$

$$+ (n'\delta z')_{m''} \times \text{secular terms of } -2\frac{d\nu'}{n'dt}$$

$$+ (\nu')_{m''} \times \text{secular terms of } 2\nu'$$

$$\begin{split} \frac{d \cdot \delta \nu'}{n'dt} &= -\frac{\mathrm{I}}{2} \left( \frac{\overline{d^2 \mathbf{W}_0}'}{d \gamma'^2} \right)_{m''} \times \text{secular terms of} \quad n' \delta z' \\ &+ (n' \delta z')_{m''} \quad \times \text{secular terms of} - \frac{\mathrm{I}}{2} \left( \frac{\overline{d^2 \mathbf{W}_0}'}{d \gamma'^2} \right) \end{split}$$

For the second factors of the terms of these equations we have the values

$$-2n'\delta z' \times \frac{1}{2}'' = [5.5104]n't \sin g' + [5.7152]n't \cos g'$$

$$+ [3.6566]n't \sin 2g' + [3.8615]n't \cos 2g'$$

$$+ [2.10]n't \sin 3g' + [2.31]n't \cos 3g'$$

$$-2\frac{dv'}{n'dt} \times \frac{1}{2}'' = [5.2094]n't \sin g' + [5.4142]n't \cos g' + [3.9577]n't \sin 2g' + [4.1526]n't \cos 2g' + [2.76]n't \sin 3g' + [2.96]n't \cos 3g'$$

$$2\nu' \times \frac{1}{2}'' = [3.9585]n't$$

$$+ [5.2094]n't \cos g' - [5.4142]n't \sin g'$$

$$+ [3.6566]n't \cos 2g' - [3.8615]n't \sin 2g'$$

$$+ [2.28]n't \cos 3g' - [2.48]n't \sin 3g'$$

$$-\frac{1}{2} \left( \frac{\overline{d^2 W_0'}}{d \gamma'^2} \right) \times \frac{1}{2}'' = -\left[ 4.9084 \right] n't \cos g' + \left[ 5.1132 \right] n't \sin g'$$
$$-\left[ 3.9577 \right] n't \cos 2g' + \left[ 4.1626 \right] n't \sin 2g'$$

The following expression for  $-\frac{1}{2}\left(\frac{\overline{d^2W_0'}}{d\gamma'^2}\right)_{m''}$  is derived from the value of  $-\frac{1}{2}\frac{dW_0'}{d\gamma'}$ , obtained in Chapter III:

| Arg=i'g''+ig'  | $-\frac{1}{2}\left(\frac{\overline{d^2}}{\overline{d}}\right)$ | $\frac{\overline{W_0'}}{{\gamma'}^2}\Big)_{m''}$  | Arg=i'g''+ig'  | $-\frac{1}{2}\left(\frac{\overline{d^2\mathbf{W}o'}}{d\gamma'^2}\right)_{m''}$   |  |  |

The five products being now computed, and the first three added to  $\overline{\delta W_0}'$  and the last two to  $-\frac{1}{2}(\frac{\overline{d} \cdot \delta W_0'}{d\gamma'})$ , we have the following expressions for the portions of  $\frac{d \cdot \delta^2 z'}{dt}$  and  $\frac{d \cdot \delta \nu'}{n'dt}$ , which have the factor n't, the portions independent of this factor being the same as for  $\overline{\delta W_0}'$  and  $-\frac{1}{2}(\frac{\overline{d} \cdot \delta W_0'}{d\gamma'})$ :

By integrating the preceding expressions we obtain the values of  $n'\delta^2z'$  and  $\delta\nu'$ . In the following statement of these values the proper number of decimals is restored to the coefficients multiplied by n't:

|                   |          |             |  | <u> </u>     | <u> </u> |            |          |                        |

Thinking that possibly the second-order terms in  $\delta T'$  not factored by the time might sensibly affect the long-period inequality in the longitude having the argument 3g''-g', I have made a rough determination of them. But as the resulting quantity was quite small, it seems unnecessary to give more details in reference to it than the following:

I found

$$\frac{d\mathbf{T}'}{dg'}n'\delta z' = 0.000000 \sin(3g'' - g') - 0.000005 \cos(3g'' - g')$$

$$\frac{d\mathbf{T}'}{dg''}n''\delta z'' = + 0.000039 + 0.000009$$

$$r'\frac{d\mathbf{T}'}{dr'}v' = - 0.000013 + 0.000006$$

$$r''\frac{d\mathbf{T}'}{dr''}v'' = - 0.000007 + 0.000035$$

$$\delta \mathbf{T}' = + 0.000019 \sin(3g'' - g') + 0.000045 \cos(3g'' - g')$$

Whence, by twice integrating,

$$n'\delta^2z' = -\circ''.\circ\circ_7 i \sin(3g'' - g') - \circ''.\circ i67 \cos(3g'' - g')$$

## CHAPTER XXII.

PERTURBATIONS OF JUPITER PROPORTIONAL TO THE PRODUCT OF THE MASSES OF SATURN AND URANUS.

We now attend to the sensible inequalities of Jupiter and Saturn whose arguments involve not only the mean anomalies of these two planets but also that of Uranus. They all owe their sensible magnitude to large integrating factors. In the present chapter we investigate the inequalities of this kind which belong to Jupiter. They are only two in number, having severally the arguments 6g' - 2g - 3g'' and 6g' - 3g - 3g''.

If we divide the function T into the two portions,  $T_{m'}$  and  $T_{m''}$ , severally produced by the action of Saturn and Uranus, and adopt a similar division and notation for  $n\delta z$ ,  $n'\delta z'$ ,  $n''\delta z''$ ,  $\nu$ ,  $\nu'$ , and  $\nu''$ , the portion of the correction  $\delta T$  of T, which produces the terms of the kind we are seeking, is

$$\begin{split} \delta \mathbf{T} &= & \frac{d\mathbf{T}_{\mathbf{m}'}}{dg} (n \delta z)_{\mathbf{m}''} + \frac{d\mathbf{T}_{\mathbf{m}'}}{dg'} (n' \delta z')_{\mathbf{m}''} &+ r \frac{d\mathbf{T}_{\mathbf{m}'}}{dr} \cdot \nu_{\mathbf{m}''} + r' \frac{d\mathbf{T}_{\mathbf{m}'}}{dr'} \cdot \nu'_{\mathbf{m}''} &+ \mathbf{C}_{\mathbf{m}'} \left( \delta \frac{h}{h_0} \right)_{\mathbf{m}''} \\ &+ \frac{d\mathbf{T}_{\mathbf{m}''}}{dg} (n \delta z)_{\mathbf{m}'} + \frac{d\mathbf{T}_{\mathbf{m}''}}{dg''} (n'' \delta z'')_{\mathbf{m}'} + r \frac{d\mathbf{T}_{\mathbf{m}''}}{dr} \cdot \nu_{\mathbf{m}'} + r' \frac{d\mathbf{T}_{\mathbf{m}''}}{dr''} \cdot \nu''_{\mathbf{m}'} + \mathbf{C}_{\mathbf{m}''} \left( \delta \frac{h}{h_0} \right)_{\mathbf{m}'} \end{split}$$

It has been assumed that all terms arising from inclination of orbits may be neglected. Of the ten terms of this formula it is discovered that two, the seventh and ninth, are quite insignificant. The first factors of the first five terms have been determined in Chapter VIII, and are there designated severally as A, F, B, G, and C.  $T_{m''}$  is given in Chapter IV. The factors  $r\frac{dT_{m''}}{dr}$  and  $C_{m''}$  we have had no occasion to derive. The terms which here depend on them are so minute that it is accurate enough to estimate the few terms of these factors by a sort of induction. We assume that  $r\frac{dT_{m''}}{dr}$  and  $C_{m''}$  bear the same relation to  $T_{m''}$  that  $r\frac{dT_{m'}}{dr}$  and  $C_{m'}$  do to  $T_{m'}$ . In this way we get, the coefficients in seconds of arc being expressed by their logarithms,

$$\begin{split} r\frac{d\mathbf{T}_{m''}}{dr} &= -\left[9.36\right]\sin\left(3g'' - 2g\right) + \left[9.48\right]\cos\left(3g'' - 2g\right) \\ &+ \left[9.43\right]\sin\left(3g'' - 3g\right) - \left[9.92\right]\cos\left(3g'' - 3g\right) \\ &+ \left[8.52\right]\sin\left(3g'' - 4g\right) - \left[9.12\right]\cos\left(3g'' - 4g\right) \\ \mathbf{C}_{m''} &= -\left[8.86\right]\sin\left(3g'' - 2g\right) + \left[8.98\right]\cos\left(3g'' - 2g\right) \\ &+ \left[8.93\right]\sin\left(3g'' - 3g\right) - \left[9.41\right]\cos\left(3g'' - 3g\right) \\ &- \left[8.90\right]\sin\left(3g'' - 4g\right) + \left[8.60\right]\cos\left(3g'' - 4g\right) \end{split}$$

The second factors of the formula have already been given, with the exception of  $\delta(\frac{h}{h_0})_{a}$ , which is given by the equation

$$\delta\binom{h}{h_0}_{m''} = -\frac{d \cdot (n\delta z)_{m''}}{ndt} - 2\nu_{m''}$$

It is sufficient to compute in  $\delta T$  the coefficients of the terms having the four arguments

$$-\gamma + 6g' - 2g - 3g''$$
  $-\gamma + 6g' - g - 3g''$   $6g' - 2g - 3g''$   $\gamma + 6g' - 3g - 3g''$ 

For those having the argument 6g' - 2g - 3g'' it is necessary to employ the complete formula, involving eight terms; but in the case of the remaining three arguments, which involve  $\gamma$ , it suffices to reduce the expression of  $\delta T$  to

$$\delta \mathbf{T} = \mathbf{F} (n' \delta z')_{m''} + \mathbf{G} \nu'_{m''}$$

In computing the terms with the argument 6g' - 2g - 3g'' the following are all the combinations of arguments (by subtraction) which give sensible results:

A, B, or C 
$$(n\delta z)_{m''}$$
,  $\nu_{m''}$ , or  $\delta\left(\frac{h}{h_0}\right)_{m''}$  For G  $(n'\delta z')_{m''}$  or  $\nu'_{m''}$   $6g'-3g$  with  $3g''-g$   $5g'-2g$  with  $3g''-g'$   $6g'-4g$  with  $3g''-2g$  with  $3g''-2g'$   $6g'-5g$  with  $3g''-3g$   $3g'-2g$  with  $3g''-3g'$   $6g'-6g$  with  $3g''-4g$   $2g'-2g$  with  $3g''-4g'$   $2g'-2g$  with  $3g''-4g'$   $3g''-4g$  with  $6g'-4g$   $3g''-3g$  with  $6g'-5g$   $3g''-4g$  with  $6g'-5g$   $3g''-4g$  with  $6g'-6g$ 

In the terms of  $\delta T$ , containing  $\gamma$  in their arguments, the combinations giving sensible results are

For 
$$-\gamma + 6g' - 2g - 3g''$$

For  $G$ 

For  $G$ 
 $(n'\delta z')_{m''}$  or  $v'_{m''}$ 

For  $G$ 
 $(n'\delta z')_{m''}$  or  $v'_{m''}$ 

For  $G$ 
 $(n'\delta z')_{m''}$  or  $v'_{m''}$ 
 $-\gamma + 5g' - 2g$  with  $3g'' - 2g'$ 
 $-\gamma + 4g' - 2g$  with  $3g'' - 2g'$ 
 $-\gamma + 3g' - 2g$  with  $3g'' - 3g'$ 
 $-\gamma + 3g' - g$  with  $3g'' - 3g'$ 
 $-\gamma + 2g' - g$  with  $3g'' - 3g'$ 
 $-\gamma + 2g' - g$  with  $3g'' - 4g'$ 

For 
$$\gamma + 6g' - 3g - 3g''$$
  
F or G  $(n'\delta z')_{m''}$  or  $\nu'_{m''}$   
 $\gamma + 5g' - 3g$  with  $3g'' - g'$   
 $\gamma + 4g' - 3g$  with  $3g'' - 2g'$   
 $\gamma + 3g' - 3g$  with  $3g'' - 3g'$ 

These details suffice to show how the terms we seek are to be obtained. But the results are limited, in point of precision, to quantities of two dimensions with respect to disturbing forces. However, in the coefficients of the terms having the arguments 6g'-2g-3g'' and  $-\gamma+6g'-2g-3g''$ , it is necessary to have their variations proportional to t, which are of three dimensions with respect to disturbing forces. As it is impossible to follow a rigorous process in getting these terms, on account of the numerous combinations, we are compelled to resort to very much abbreviated formulæ. There is no proof that the latter afford results sufficiently accurate for practical purposes, yet there is reason for thinking that they give the salient portion of these terms. It is deemed sufficient to put

$$\delta \mathbf{T} = \mathbf{F}(n'\delta z')_{-n'} + \mathbf{G}\nu'_{-n'}$$

Each of the four factors in the right member of this equation must be supposed to receive an augmentation proportional to nt. Operating then on the equation with the symbol  $\delta$  we have

$$\delta^{2}T = F(n'\delta^{2}z')_{m''} + G\delta\nu'_{m''} + \delta F \cdot (n'\delta z')_{m''} + \delta G \cdot \nu'_{m''}$$

Of the factors involved in this  $(n'\delta^2z')_{m''}$  and  $\delta\nu'_{m''}$  have been determined in the preceding chapter. Of the two new quantities  $\delta F$  and  $\delta G$  introduced into the equation, when we recall that  $F = \frac{d\mathbf{T}}{dg'}$ , it will be seen that an approximate expression for  $\delta F$  will be

$$\delta \mathbf{F} = \frac{d\mathbf{F}}{dg'} n' \delta z' + \frac{d\mathbf{G}}{dg'} \nu' + \frac{d}{dg'} \left[ \mathbf{A} n \delta z + \mathbf{B} \nu + \mathbf{C} \delta \frac{h}{h_0} \right]$$

Of the quantities involved in this equation  $\frac{d\mathbf{F}}{dg'}$  and  $\frac{d\mathbf{G}}{dg'}$  have already been used in Chapter XVII for the determination of  $\delta^2\mathbf{T}$ ;  $\mathbf{A}n\delta z + \mathbf{B}\nu$  has been computed in Chapter XI; to the factors  $n'\delta z'$  and  $\nu'$  we attribute only their secular terms as values. In like manner we have

$$\delta \mathbf{G} = \frac{d\mathbf{G}}{dg'} \mathbf{n}' \delta \mathbf{z}' + \frac{d\mathbf{G}}{dg} \mathbf{n} \delta \mathbf{z} + \left(r' \frac{d}{dr'}\right)^2 . \mathbf{T} . \mathbf{v}' + \left(r \frac{d}{dr}\right) \left(r' \frac{d}{dr'}\right) . \mathbf{T} . \mathbf{v}'$$

All the first factors of the right member of this equation have been used in Chapter XVII. As before  $n'\delta z'$ ,  $n\delta z$ ,  $\nu'$ , and  $\nu$  may be supposed reduced to their secular terms. After  $\delta T$  has been determined, it still remains to get the portion of  $n\delta^2 z$  which undergoes but one integration; this is

$$\left(\frac{\overline{dW_0}}{d\gamma}\right)n\delta z + \nu^2 = \left(\frac{\overline{dW_0}}{d\gamma}\right)_{m'}(n\delta z)_{m''} + \left(\frac{\overline{dW_0}}{d\gamma}\right)_{m''}(n\delta z)_{m'} + 2\nu_{m'}\nu_{m''}$$

The quantities involved here are so small that there is no necessity for considering any terms of three dimensions with respect to disturbing forces.

Giving to the factors involved their previously ascertained values, performing the multiplication, and preserving only the terms which are of use, we have the following expressions for  $\delta F$  and  $\delta G$ :

|                                      |            |                   | •                  |           |  |  |
|--------------------------------------|------------|-------------------|--------------------|-----------|--|--|

The following expression is obtained for  $\delta T$ :

|  | $\delta 	ext{T}$   |  |  |  |  |  |
|--|--|--|--|--|--|--|
| Argument.  | sin.   | cos.   |  |  |  |  |
| $-\gamma + 6g' - 2g - 3g''$<br>$-\gamma + 6g' - g - 3g''$<br>6g' - 2g - 3g''<br>$\gamma + 6g' - 3g - 3g''$ | +0.00099 -0.000001013nt<br>-0.00067<br>+0.0005921-0.0000001410nt<br>-0.00015 | "0. 00381 +0. 000000422nt0. 00002 +0. 00003220. 0000002907nt +0. 00009 |  |  |  |  |

The logarithms of the integrating factors are

$$6g' - g - 3g''$$
 0.0032  
 $6g' - 2g - 3g''$  2.12820n  
 $6g' - 3g - 3g''$  9.9968n

It is found that the terms from  $\left(\frac{\overline{dW_0}}{d\gamma}\right)n\delta z + \nu^2$  are insensible. By the application of the usual treatment to  $\delta T$  we get

$$n\delta z = \begin{bmatrix} -0.1396 + 0.000135nt \end{bmatrix} \sin (6g' - 3g - 3g'') + \begin{bmatrix} 0.4897 - 0.000056nt \end{bmatrix} \cos (6g' - 3g - 3g'') + \begin{bmatrix} -9.3451 + 0.002545nt \end{bmatrix} \sin (6g' - 2g - 3g'') + \begin{bmatrix} -1.2796 + 0.005246nt \end{bmatrix} \cos (6g' - 2g - 3g'') + \begin{bmatrix} -0.0698 + 0.000067nt \end{bmatrix} \cos (6g' - 3g - 3g'') + \begin{bmatrix} -0.2449 + 0.000028nt \end{bmatrix} \sin (6g' - 3g - 3g'') + \begin{bmatrix} -0.0551 \end{bmatrix} \cos (6g' - 2g - 3g'') + \begin{bmatrix} -0.0047 \end{bmatrix} \sin (6g' - 2g - 3g'')$$

## CHAPTER XXIII.

PERTURBATIONS OF SATURN PROPORTIONAL TO THE PRODUCT OF THE MASSES OF JUPITER AND URANUS.

Like those discussed in the preceding chapter these perturbations owe their sensible magnitude to large integrating factors. They are more numerous and larger than in the case of Jupiter. The formulæ for their determination are quite similar.

If we divide the function T' into the two portions,  $T'_m$  and  $T'_{m''}$ , severally produced by the action of Jupiter and Uranus, the portion of the correction  $\delta T'$  of T', which produces terms of the kind we are seeking, is

$$\begin{split} \delta \mathbf{T}' = & \mathbf{A}' (n' \delta z')_{m''} + \mathbf{B}' \nu'_{m''} + \mathbf{C}' \delta \left( \frac{h'}{h_0'} \right)_{m''} + \mathbf{F}' (n \delta z)_{m''} + \mathbf{G}' \nu_{m''} \\ & + \frac{d \mathbf{T}'_{m''}}{d g'} (n' \delta z')_{m} + r' \frac{d \mathbf{T}'_{m''}}{d r'} \nu'_{m} + \mathbf{C}'_{m''} \delta \left( \frac{h'}{h_0'} \right)_{m} + \frac{d \mathbf{T}'_{m''}}{d g''} (n'' \delta z'')_{m} + r'' \frac{d' \mathbf{T}'_{m''}}{d r''} \nu''_{m} \end{split}$$

A', B', C', F', and G' have been determined in Chapter VIII, the remaining five first factors have been employed in Chapter XXI. The factor

$$\delta \left(\frac{h'}{h_0'}\right)_{m''} = -\left(\frac{d \cdot n'\delta z'}{n'dt}\right)_{m''} - 2\nu'_{m''}$$

The factors  $(n''\delta z'')_m$  and  $\nu''_m$ , being the Jupiter-perturbations of Uranus, must be derived from the theory of the latter planet. The terms they give rise to are very small. The following are sufficiently exact expressions for these factors:\*

$$(n''\delta z'')_{m} \times \frac{1}{2}'' = -[4.49] \sin(2g - g'') - [2.03] \cos(2g - g'')$$

$$-[3.70] \sin(2g - 2g'') - [3.27] \cos(2g - 2g'')$$

$$-[3.10] \sin(2g - 3g'') - [2.88] \cos(2g - 3g'')$$

$$v''_{m} \times \frac{1}{2}'' = -[4.49] \cos(2g - g'') + [1.65] \cos(2g - g'')$$

$$+[3.55] \cos(2g - 2g'') - [3.41] \cos(2g - 2g'')$$

$$+[3.26] \cos(2g - 3g'') - [3.04] \cos(2g - 3g'')$$

The remaining factors have already been given.

As in the case of Jupiter it is necessary to consider some terms of three dimensions with respect to disturbing forces and which are factored by n't. This, however,

<sup>\*</sup>An Investigation of the Orbit of Uranus, by Prof. S. NEWCOMB, page 63.

is only necessary for the terms of  $\delta T'$  having the arguments  $\delta g' - 2g - 3g''$  and  $-\gamma' + \delta g' - 2g - 3g''$ . Here we can reduce the expression for  $\delta T'$  to

$$\delta \mathbf{T}' = \mathbf{A}' (n' \delta z')_{m''} + \mathbf{B}' \nu'_{m''} + \mathbf{A}'_{m''} (n' \delta z')_m + \mathbf{B}'_{m''} \nu'_{m}$$

Subjecting this equation to the operation  $\delta$  we have

$$\begin{split} \delta^{2}\mathbf{T}' = & \mathbf{A}'(n'\delta^{2}z')_{m''} + \mathbf{B}'\delta\nu'_{m''} + \mathbf{A}'_{m''}(n'\delta^{2}z')_{m} + \mathbf{B}'_{m''}\delta\nu'_{m} \\ & + \delta\mathbf{A}'(n'\delta z')_{m''} + \delta\mathbf{B}'\nu'_{m''} + \delta\mathbf{A}'_{m''}(n'\delta z')_{m} + \delta\mathbf{B}'_{m''}\nu'_{m} \end{split}$$

In this expression four new factors,  $\delta A'$ ,  $\delta B'$ ,  $\delta A'_{m''}$ , and  $\delta B'_{m''}$ , appear. Remembering that

$$\mathbf{A}' = \frac{d\mathbf{T}'}{dg'} \qquad \qquad \mathbf{B}' = r' \frac{d\mathbf{T}'}{dr'} \qquad \qquad \mathbf{A'}_{m''} = \frac{d\mathbf{T}'_{m''}}{dg'} \qquad \qquad \mathbf{B'}_{m''} = r' \frac{d\mathbf{T}'_{m''}}{dr'}$$

it will be seen that, with sufficient approximation, we have

$$\begin{split} \delta \mathbf{A}' &= \frac{d \mathbf{A}'}{d g'} n' \delta z' + \frac{d \mathbf{B}'}{d g'} \nu' + \frac{d}{d g'} [\mathbf{F}' n \delta z + \mathbf{G}' \nu] \\ \delta \mathbf{B}' &= \frac{d \mathbf{B}'}{d g'} n' \delta z' + \left( r' \frac{d}{d r'} \right)^2 \mathbf{T}' \cdot \nu' + \frac{d \mathbf{B}'}{d g} n \delta z + \left( r \frac{d}{d r} \right) \left( r' \frac{d}{d r'} \right) \mathbf{T}' \cdot \nu \\ \delta \mathbf{A}'_{\mathbf{m}''} &= \frac{d \mathbf{A}'_{\mathbf{m}''}}{d g'} n' \delta z' + \frac{d \mathbf{B}'_{\mathbf{m}''}}{d g'} \nu' + \frac{d \mathbf{A}'_{\mathbf{m}''}}{d g''} n'' \delta z'' + \frac{d \mathbf{G}'_{\mathbf{m}''}}{d g'} \nu'' \\ \delta \mathbf{B}'_{\mathbf{m}''} &= \frac{d \mathbf{B}'_{\mathbf{m}''}}{d g'} n' \delta z' + \left( r' \frac{d}{d r'} \right)^2 \mathbf{T}'_{\mathbf{m}''} \cdot \nu' + \frac{d \mathbf{B}'_{\mathbf{m}''}}{d g''} n'' \delta z'' + \left( r' \frac{d}{d r'} \right) \left( r'' \frac{d}{d r''} \right) \mathbf{T}'_{\mathbf{m}''} \nu'' \end{split}$$

Here the factors  $n\delta z$ ,  $n'\delta z'$ ,  $n''\delta z''$ ,  $\nu$ ,  $\nu'$ , and  $\nu''$  are to be reduced to their secular terms. The proper expressions for  $n''\delta z''$  and  $\nu''$  have already been given (page 458). F' $n\delta z + G'\nu$  has been determined in Chapter XIV. The first factors of the expressions for  $\delta A'$  and  $\delta B'$  have already been employed in the determination of the terms of three dimensions for Saturn. B' $_{m''}$  and G' $_{m''}$  have been derived in Chapter XXI. The terms which arise from the term having the factor  $(r'_{dr'})^2 T'_{m''}$  are very small. It has been thought sufficiently accurate to estimate by induction the needed terms of this factor. They are

$$\left(r'\frac{d}{dr'}\right)^{2} \mathbf{T'}_{m''} = \begin{bmatrix} 9.28 & ] \sin(3g'' - g') - [9.27 & ] \cos(3g'' - g') \\ - [0.2248] \sin(3g'' - 2g') + [0.7693] \cos(3g'' - 2g') \\ - [1.3276] \sin(3g'' - 3g') - [1.4748] \cos(3g'' - 3g') \\ - [0.6241] \sin(3g'' - 4g') - [0.3256] \cos(3g'' - 4g') \\ - [9.64 & ] \sin(3g'' - 5g') - [9.13 & ] \cos(3g'' - 5g')$$

On account of the smallness of  $\nu''$  the last term of  $\delta B'_{m''}$  has been neglected. Lastly, for the terms of  $\delta T'$ , having the argument  $-\nu' + 6g' - 2g - 3g''$ , it suffices to consider  $\delta A'$  and  $\delta B'$  alone, omitting altogether  $\delta A'_{m''}$  and  $\delta B'_{m''}$ .

Computing the terms of two dimensions of  $\delta T'$ , which have the argument 6g'-2g-3g'', we obtain severally for each of the ten terms

$$A'(n'\delta z')_{m''} = -0.0044383 \sin (6g' - 2g - 3g'') - 0.0003686 \cos (6g' - 2g - 3g'')$$

$$B'\nu'_{m''} = -0.0026341 + 0.0003563$$

$$C'\delta\left(\frac{h'}{h_0'}\right)_{m''} = +0.0000205 + 0.0001902$$

$$F'(n\delta z)_{m''} = -0.0000042 + 0.0000342$$

$$G'\nu_{m''} = -0.0000042 + 0.0000342$$

$$B'_{m''}\nu'_{m} = -0.0032506 + 0.0000926$$

$$B'_{m''}\nu'_{m} = -0.0024209 - 0.0002530$$

$$C'_{m''}\delta\left(\frac{h'}{h_0'}\right)_{m} = +0.0000094 - 0.0002299$$

$$\frac{dT'_{m''}}{dg''}(n''\delta z'')_{m} = -0.0000001 + 0.0000003$$

$$r''\frac{dT'_{m''}}{dg'''}\nu''_{m} = +0.00000014$$

And their sum

$$\delta T' = -\circ''.\circ 127282 \sin(6g' - 2g - 3g'') - \circ''.\circ \circ 1363 \cos(6g' - 2g - 3g'')$$

In like manner the terms having the argument  $-\gamma' + 6g' - 2g - 3g''$  are composed as follows:

$$A'(n'\delta z')_{m''} = + 0.02049 \sin \left(-y' + 6g' - 2g - 3g''\right) + 0.01306 \cos \left(-y' + 6g' - 2g - 3g''\right)$$

$$B'\nu'_{m''} = + 0.01484 + 0.00461$$

$$C'\delta \left(\frac{h'}{h_0'}\right)_{m''} = + 0.00016 + 0.00028$$

$$F'(n\delta z)_{m''} = + 0.00008 + 0.00009$$

$$G'\nu_{m''} = + 0.00029 + 0.00034$$

$$r'\frac{dT'_{m''}}{dg'}\nu'_{m} = - 0.00019 + 0.00022$$

$$C'_{m''}\delta \left(\frac{h'}{h_0}\right)_{m} = - 0.00007 + 0.00020$$

And their sum

$$\delta T' = + \circ'' \cdot \circ 3512 \sin \left( - \gamma' + 6g' - 2g - 3g'' \right) + \circ'' \cdot \circ 1799 \cos \left( - \gamma' + 6g' - 2g - 3g'' \right)$$

In computing the terms of three dimensions having these arguments, it has been found that

$$A'(n'\delta^{2}z')_{m''} = + 0.000001691n't \sin (6g' - 2g - 3g'') + 0.00000669n't \cos (6g' - 2g - 3g'')$$

$$B'\delta v'_{m''} = + 0.000000657 - 0.00000066$$

$$A'_{m''}(n'\delta^{2}z')_{m} = - 0.00000071 + 0.000003517$$

$$B'_{m''}\delta v'_{m} = + 0.000000258 + 0.000002653$$

$$\delta A'(n'\delta z')_{m''} = + 0.000000171 + 0.000002409$$

$$\delta A'_{m''}(n'\delta z')_{m} = + 0.00000171 + 0.00000258$$

$$\delta B'_{m''}v'_{m} = + 0.000000269 + 0.000000182$$

And their sum

$$\delta^2 T' = + \circ''.000007169n't \sin(6g' - 2g - 3g'') + \circ''.000012798n't \cos(6g' - 2g - 3g'')$$

In a similar manner for the terms belonging to the argument -y' + 6g' - 2g - 3g''

$$A'(n'\delta^{2}z')_{m''} = -0.0000071n't \sin(-\gamma' + 6g' - 2g - 3g'') - 0.0000074n't \cos(-\gamma' + 6g' - 2g - 3g'')$$

$$B'\delta\nu'_{m''} = -0.0000067$$

$$\delta A'(n'\delta z')_{m''} = +0.0000002$$

$$-0.0000010$$

$$-0.0000087$$

$$-0.0000104$$

And their sum

$$\delta^{2}T' = -0.0000048n't \sin(-\gamma + 6g' - 2g - 3g'') - 0.0000275n't \cos(-\gamma' + 6g' - 2g - 3g'')$$

Adding to the previous terms those dependent on the arguments  $-\gamma' + 7g' - 2g - 3g''$  and  $\gamma' + 5g' - 2g - 3g''$ , of the computation of which it is thought unnecessary to give any details, we have the following complete expression for  $\delta T'$ :

| Argument.   | sin.   | cos.  |
|---|--|---|
| $-\gamma' + 6g' - 2g - 3g''$ $-\gamma' + 7g' - 2g - 3g''$ $6g' - 2g - 3g''$ $\gamma' + 5g' - 2g - 3g''$ | +0. 03512 -0. 0000048 $n't$<br>+0. 01155<br>0. 0127282+0. 000007169 $n't$<br>+0. 00419 | +0.01799 -0.0000275n't<br>+0.00092<br>-0.0001363+0.000012798n't<br>-0.00039 |

The logarithms of the integrating factors are

$$7g' - 2g - 3g''$$
 0.0081  
 $6g' - 2g - 3g''$  1.73316n  
 $5g' - 2g - 3g''$  9.9920n

The very familiar process being applied to  $\delta T'$  we get

$$\overline{\delta W_0'} = \begin{bmatrix} 1.8193 - 0.000260n't \end{bmatrix} \cos (5g' - 2g - 3g'') \\ + [-0.9874 + 0.001488n't] \sin (5g' - 2g - 3g'') \\ + [-0.65875 + 0.0003878n't] \cos (6g' - 2g - 3g'') \\ + [0.02967 - 0.0006923n't] \sin (6g' - 2g - 3g'') \\ - \frac{1}{2} \left( \frac{\overline{d \cdot \delta W_0'}}{dy'} \right) = [-0.9996 + 0.000130n't] \sin (5g' - 2g - 3g'') \\ + [-0.4937 + 0.000744n't] \cos (5g' - 2g - 3g'') \\ + [0.00794 ] \sin (6g' - 2g - 3g'') \\ + [0.00028 ] \cos (6g' - 2g - 3g'')$$

In order to have the value of  $\frac{d \cdot \delta^2 z'}{dt}$  it is necessary to add to the first of these expressions the terms which arise from

$$\left(\frac{\overline{dW_0'}}{dy'}\right)n'\delta z' + \nu'^2$$

When this is expanded it takes the form

$$\left(\frac{\overline{dW_0'}}{d\gamma'}\right)_{\!\!m}(n'\delta z')_{\!\!m'} + \left(\frac{\overline{dW_0'}}{d\gamma'}\right)_{\!\!m'}(n'\delta z')_{\!\!m} + 2\nu'_{\!\!m}\nu'_{\!\!m''}$$

These terms are significant only in the case of the argument 6g' - 2g - 3g''. All the factors involved have been already given. It is found that

$$\left(\frac{\overline{dW_0'}}{\overline{d\gamma'}}\right)_{m}(n'\delta z')_{m''} = + 0.03468 \cos(6g' - 2g - 3g'') + 0.01438 \sin(6g' - 2g - 3g'') 
\left(\frac{\overline{dW_0'}}{\overline{d\gamma'}}\right)_{m''}(n'\delta z')_{m} = + 0.03505 + 0.01353$$

$$2\nu'_{m}\nu'_{m''} = - 0.01810 - 0.00707$$

And their sum

$$= + 0.05163 \cos (6g' - 2g - 3g'') + 0.02084 \sin (6g' - 2g - 3g'')$$

It is necessary to consider the terms of three dimensions factored by n't which arise from the same source, and which are given by the formula

All the factors of the six terms of this expression have been given in preceding chapters. It is found that

$$\left(\frac{\overline{dW_0'}}{\overline{dy'}}\right)_m (n'\delta^2 z')_{m''} = -0.0000094n't \cos(6g' - 2g - 3g'') - 0.0000056n't \sin(6g' - 2g - 3g'')$$

$$\left(\frac{\overline{dW_0'}}{\overline{dy'}}\right)_{m''} (n'\delta^2 z')_m = -0.0000193 + 0.0000356$$

$$2v'_m \delta v'_{m''} = +0.0000100 + 0.0000184$$

$$2v'_{m''} \delta v'_{m} = +0.0000100 + 0.0000184$$

$$-2\frac{d \cdot \delta v'_{m''}}{n'dt} (n'\delta z')_{m''} = -0.0000211 + 0.0000369$$

$$-2\frac{d \cdot \delta v'_{m''}}{n'dt} (n'\delta z')_m = -0.0000093 - 0.0000053$$

And their sum =  $-0.0000444n't \cos(6g' - 2g - 3g'') + 0.0000460n't \sin(6g' - 2g - 3g'')$ 

In consequence

$$\frac{d \cdot \delta^2 z'}{dt} = \begin{bmatrix} 1.8193 & -0.000260n't \end{bmatrix} \cos (5g' - 2g - 3g'') \\ + \begin{bmatrix} -0.9874 & +0.001488n't \end{bmatrix} \sin (5g' - 2g - 3g'') \\ + \begin{bmatrix} -0.60712 + 0.0003434n't \end{bmatrix} \cos (6g' - 2g - 3g'') \\ + \begin{bmatrix} 0.05051 - 0.0006463n't \end{bmatrix} \sin (6g' - 2g - 3g'') \end{bmatrix}$$

And, by integration,

$$n'\delta^{2}z' = \begin{bmatrix} -1.7848 + 0.000255n't \end{bmatrix} \sin (5g' - 2g - 3g'') + [-0.9698 + 0.001461n't] \cos (5g' - 2g - 3g'') + [30.951 - 0.01858n't] \sin (6g' - 2g - 3g'') + [3.738 - 0.03496n't] \cos (6g' - 2g - 3g'')$$

Neglecting any further consideration of terms in  $\delta \nu'$ , we get

$$\delta \nu' = \begin{bmatrix} -0.8921 + 0.000128n't \end{bmatrix} \cos (5g' - 2g - 3g'') + \begin{bmatrix} 0.4848 - 0.000730n't \end{bmatrix} \sin (5g' - 2g - 3g'') + \begin{bmatrix} 0.4295 \end{bmatrix} \cos (6g' - 2g - 3g'') - \begin{bmatrix} 0.0151 \end{bmatrix} \sin (6g' - 2g - 3g'')$$

This completes the determination of the inequalities of Saturn having the arguments 5g' - 2g - 3g'' and 6g' - 2g - 3g''. But there are certain other inequalities of long period depending on all three anomalies. The following is a list of all that seemingly could be of any importance, together with the logarithms of their integrating factors:

| Argu                 | ment.    | Log. integrating factor. | Argument.                              | Log. integrating factor. |
|----------------------|----------|--------------------------|--|--------------------------|
| $g^{\prime\prime}$ + | 2g'-g    | 0.8771 <i>n</i>          | $6g^{\prime\prime} - 7g^{\prime} + 2g$ | 1.1527                   |
| $g^{\prime\prime}$ — | 3g' + g  | 0.7796n                  | $7g^{\prime\prime} - 5g^{\prime} + g$  | 1.2051n                  |
| 2g'' —               | 3g' + g  | 0.7340                   | $7g'' - 1 \circ g' + 3g$               | 1.01917                  |
| 3g'' +               | 4g' - 2g | 1.0696                   | 9g'' - 8g' + 2g                        | 0.9133                   |
| 4 <i>9''</i> +       | g'-g     | 1.0926n                  | 10g'' - 11g' + 3g                      | 1.3579n                  |
| 4 <i>9''</i> —       | 4g' + g  | 0 9423n                  | 10g'' - 6g' + g                        | 1.9784n                  |
| 4g'' —               | 99' + 39 | 0.8312n                  |  |                          |

As the inequalities having these arguments are evidently quite small it will suffice to compute them by the most abbreviated formulæ. We take for  $\delta T'$  only the portion independent of  $\gamma'$ , and then have

$$n'\delta^2 z' = \iint \delta \mathbf{T}' n'^2 dt^2$$

We may limit  $\delta T'$  to the following terms

$$\delta \mathbf{T}' = \mathbf{A}' (n' \delta z')_{m''} + \mathbf{B}' \nu'_{m''} + \mathbf{A}'_{m''} (n' \delta z')_{m} + \mathbf{B}'_{m''} \nu'_{m}$$

The following expressions have been found for  $\delta T'$  and  $n' \delta^2 z'$ :

| 4  | δ΄         | Γ'         | $n'\delta^2z'$      |              |  |

## CHAPTER XXIV.

PERTURBATIONS OF THE LATITUDE OF JUPITER OF THE SECOND ORDER WITH RESPECT TO DISTURBING FORCES.

The sensible terms of these perturbations of the latitudes of our two planets arise only from their mutual action. They are quite small, and hence admit some simplifications in their computation, besides those indicated by Hansen in the Auseinander-setzung.

The co-ordinate u being obtained through the equations \*

$$\frac{1}{n}\frac{d\mathbf{R}_{0}}{dt} = \frac{h}{n}r\frac{\rho}{a_{0}}\sin\left(\omega - \hat{f}\right)\left(\frac{d\Omega}{dZ}\right)\cos i = \mathbf{U}$$

$$u = \overline{\mathbf{R}}_{0} + \left(\frac{\overline{d\mathbf{R}}_{0}}{d\gamma}\right)n\delta z$$

similarly with Hansen† we will put

$$\frac{d \cdot \delta \mathbf{R}_0}{ndt} = \mathbf{A}'' n \delta z + \mathbf{B}''(\nu - c) + \mathbf{C}'' \delta \frac{h}{h_0} + \mathbf{D}'' \frac{u}{\cos i} + \mathbf{E}'' \frac{u_1}{\cos i} + \mathbf{F}'' n' \delta z' + \mathbf{G}''(\nu' - c') + \mathbf{H}'' \frac{u'}{\cos i'}$$

We have

$$\mathbf{A}'' = \frac{d\mathbf{U}}{dq} \qquad \qquad \mathbf{B}'' = \mathbf{Y} + \mathbf{U}$$

where

$$\mathbf{Y} = \frac{h}{n} r^2 \frac{\rho}{a_0} \sin \left(\omega - \tilde{f}\right) \frac{d^2 \Omega}{dr dZ} \cos i = \mathbf{C} a^2 r \frac{d^2 \Omega}{dr dZ} \cos i$$

C being the quantity so denoted (page 76);  $a^2r\frac{d^2\Omega}{drdZ}$  has already been derived in computing D, one of the factors involved in  $\delta T$ . Next we have

$$C'' = \overline{U}$$

In the computation of D" and E" Hansen puts D" =  $D_1$ " +  $D_2$ " and E" =  $E_1$ " +  $E_2$ "; but  $D_2$ " and  $E_2$ " are quantities of the second order with reference to sin *i*, sin *i*, and sin J, besides being of the order of the disturbing force. Hence,  $D_2$ "  $\frac{u}{\cos i}$  and  $E_2$ "  $\frac{u_1}{\cos i}$ ,

<sup>\*</sup>Auseinandersetzung, Abth. I, pp. 102, 103, gl. (45), (46). †Auseinandersetzung, Abth. I, p. 133, gl. (83).

being of the third order with reference to the inclinations and of the second with reference to disturbing forces, may be neglected. We can then write

$$\begin{split} \mathbf{D}'' &= \mathbf{C}a^2 \bigg[ a \frac{d^2 \Omega}{d Z^2} + \frac{e \sin f}{r \cos^2 \varphi} \frac{d \Omega}{d f} - \frac{a}{r} \frac{d \Omega}{d r} \bigg] \cos i \\ &= \mathbf{C} \bigg[ a^3 \frac{d^2 \Omega}{d Z^2} + \frac{e r \sin f}{\cos^3 \varphi} \frac{d \Omega}{d g} - \frac{1 + 2e \cos f + e^2}{\cos^4 \varphi} a r \frac{d \Omega}{d r} \bigg] \cos i \\ \mathbf{E}'' &= -\mathbf{C} \frac{a^2}{r \cos \varphi} \frac{d \Omega}{d f} = -\mathbf{C} \frac{a}{r} \mathbf{T} \end{split}$$

In addition we have\*

$$\mathrm{F}^{\prime\prime} = rac{d\,\mathrm{U}}{d\,g^\prime}$$
  $\mathrm{G}^{\prime\prime} = -\,(\mathrm{Y}\,+\,2\,\mathrm{U})$   $\mathrm{H}^{\prime\prime} = \mathrm{C}a^2a^\primerac{d^2\Omega}{dZdZ^\prime}\cos\,i$ 

Thus, we can write

$$\begin{split} \delta \mathbf{U} &= \frac{d\mathbf{U}}{dg} n \delta z + \frac{d\mathbf{U}}{dg'} n' dz' + \mathbf{Y} (\nu - c - \nu' + c') + \mathbf{U} \left( \nu - 2\nu' + 2c' + \delta \frac{h}{h_0} \right) \\ &+ \mathbf{D}'' \frac{u}{\cos i} + \mathbf{E}'' \frac{u_1}{\cos i} + \mathbf{H}'' \frac{u'}{\cos i'} \end{split}$$

Here  $\delta U$  appears as the sum of seven products instead of eight, as with Hansen. It is necessary, then, to compute the developments of the four factors Y, D'', E'', and H''. By neglecting certain terms factored by  $\sin^2 J$  we can put  $\dagger$ 

$$a^{3}\frac{d^{2}\Omega}{dZ^{2}} = -\mu\alpha^{2}\left(\frac{\mathbf{a}'}{\triangle}\right)^{3}$$

$$a^{2}\alpha'\frac{d^{2}\Omega}{dZdZ'} = \mu\alpha\left[\left(\frac{\mathbf{a}'}{\triangle}\right)^{3} - \left(\frac{\mathbf{a}'}{r'}\right)^{3}\right]$$

Of the factors involved in D" it is sufficient to put

$$\frac{er \sin f}{a \cos^3 \varphi} = 2[8.3833] \sin g + 2[6.7655] \sin 2g$$

$$\frac{1 + 2e \cos f + e^2}{\cos^4 \varphi} = [0.0010] + 2[8.6854] \cos g + 2[7.3688] \cos 2g$$

In addition

$$\left(\frac{a'}{r'}\right)^3 = 1.0047 + 0.1689 \cos g' + 0.0142 \cos 2g' + 0.0012 \cos 3g'$$

$$C_{\overline{r}}^a = 2[9.6980] \sin (\gamma - g) - 2[8.3825] \sin \gamma + 2[8.3817] \sin (\gamma - 2g) + 2[7.12] \sin (\gamma - 3g)$$

In all these computations it is unnecessary to pay attention to the factor  $\cos i$ , as we intend to take the plane of the orbit at the epoch 1850 as the plane of reference, which makes  $i_0 = 0$ .

<sup>\*</sup>Auseinandersetzung, Abth. I, p. 136, gl. (97), (98), (99).

<sup>†</sup>Auseinandersetzung, Abth. I, p. 120.

The following is the result of the computation of  $\frac{D''}{C}$ , the only quantity independent of  $\gamma$  which it is worth while to give:

| Arg=i'g'+ig  | D    | <u>'''</u>  | Arg=i'g'+ig | $\frac{\mathbf{D}}{\mathbf{C}}$  | ,,,,<br><u>O</u>  | Arg=i'g'+ig  | <u>D</u>   |   |

In order to obtain a higher degree of precision in the second factors of the terms of  $\delta U$ , we attribute to  $n\delta z$ ,  $\nu$ ,  $n'\delta z'$ , and  $\nu'$  the values which result from adding together the terms of the first, second, and third orders with respect to disturbing forces. It is thought unnecessary to give here the expressions of these second factors, as they are so easily formed from data previously given.

The terms having the argument  $-\gamma$  in  $\delta U$  are important, as they determine the amount of the secular motion of the plane of the orbit due to the square and product of the masses of Jupiter and Saturn. The following detail of the composition of these terms is therefore given:

$$\frac{dU}{dg}n\delta z = -\frac{u}{0.0002260\cos(-\gamma) - 0.0006051\sin(-\gamma)}$$

$$\frac{dU}{dg'}n'\delta z' = -0.0006676 - 0.0021977$$

$$U\left(\nu - 2\nu' + 2c' + \delta \frac{h}{h_0}\right) = -0.0002280 - 0.0006215$$

$$Y(\nu - c - \nu' + c') = -0.0004473 - 0.0012610$$

$$D''\frac{u}{\cos i} = -0.0000396 - 0.000871$$

$$E''\frac{u_1}{\cos i} = -0.0000051 - 0.0000128$$

$$H''\frac{u'}{\cos i'} = -0.0001084 - 0.0002514$$

$$Snm = -0.0017220\cos(-\gamma) - 0.0050366\sin(-\gamma)$$

The following is the complete expression for  $\delta U$ :

| Arg=   | δU  |  |   |   |  |  |  |

In order to have the value of  $\delta\left(\frac{u}{\cos i}\right)$  it is necessary to add to this expression the value of  $\left(\frac{dR_0}{d\gamma}\right)n\delta z$ , which follows:

| Arg=i'g'+ig  | $\Big( rac{\overline{dR_0}}{d\overline{y}} \Big) n \delta z$ |  |  |  |  |  |

The only terms of the third order with respect to disturbing forces in the latitude of Jupiter which it seems worth while to consider are the secular terms factored by the cube of the time. As these terms are scarcely appreciable after the lapse of 500 years a very rude computation of their coefficients suffices. If b, l, i, and  $\theta$  denote severally the latitude, longitude, inclination of orbit, and longitude of the ascending node of Jupiter, all referred to the fixed ecliptic and equinox of 1850.0, we have

$$\sin\,b = \sin\,i\,\sin\,(l-\theta) = \sin\,i\,\cos\,\theta\,\sin\,l - \sin\,i\,\sin\,\theta\,\cos\,l$$

and

$$\frac{d(\sin i \cos \theta)}{dt} = \cos i \cos \theta \frac{di}{dt} - \sin i \sin \theta \frac{d\theta}{dt}$$
$$\frac{d(\sin i \sin \theta)}{dt} = \cos i \sin \theta \frac{di}{dt} + \sin i \cos \theta \frac{d\theta}{dt}$$

The following values of i and  $\theta$ , adopted from the values given by Leverrier,\* are sufficiently accurate for our purpose:

| Date.                                | i  | θ  | $\frac{di}{dt}$   | $\frac{d\theta}{dt}$                           |  |
|--------------------------------------|--|--|---|--|--|

The unit of T is a century of Julian years. From these special values we obtain

and by integrating these equations

$$\sin i \cos \theta = \text{const.} - \text{i}_{3.0811}\text{T} - \text{o.o6}_{744}\text{T}^2 + \text{o.ooo}_{322}\text{T}^3$$
  
 $\sin i \sin \theta = \text{const.} - \text{g.5}_{134}\text{T} + \text{o.o8}_{786}\text{T}^2 + \text{o.ooo}_{238}\text{T}^3$ 

As these values correspond to a mass of Saturn  $=\frac{1}{35^{12}}$  we augment them a little, and adopt as the terms of the sine of the latitude proportional to the cube of the time,

$$\sin\,b = +\, \circ^{\prime\prime}.000324 \mathrm{T}^3 \sin\,l - 0^{\prime\prime}.000240 \mathrm{T}^3 \cos\,l$$

<sup>\*</sup>Annales de l'Observatoire de Paris, Mémoires, Tome XI, pp. 7, 47.

## CHAPTER XXV.

PERTURBATIONS OF THE LATITUDE OF SATURN OF THE SECOND ORDER WITH RESPECT TO DISTURBING FORCES.

The formulæ to be employed here are precisely similar to those of the preceding chapter. The co-ordinate u' is obtained through the equations

$$egin{aligned} & rac{1}{n'}rac{d ext{R}_0'}{d au} &= rac{h'}{n'}r'rac{
ho'}{a'}\sin{(\omega'-f')}\Big(rac{d\Omega'}{dZ'}\Big)\cos{i'} &= \mathbf{U}' \ & u' &= ext{R}_0' + \Big(rac{\overline{d ext{R}_0'}}{d{V'}}\Big)n'\delta z' \end{aligned}$$

For the variation of U' we have

$$\begin{split} \delta \mathbf{U}' &= \frac{d \mathbf{U}'}{d g'} n' \delta z' + \frac{d \mathbf{U}'}{d g} n \delta z + \mathbf{Y}' (\nu' - c' - \nu + c) + \mathbf{U}' \left( \nu' - 2\nu + 2c + \delta \frac{h'}{h_0'} \right) \\ &+ \mathbf{D}'' \frac{u'}{\cos i'} + \mathbf{E}'' \frac{u_1'}{\cos i'} + \mathbf{H}'' \frac{u}{\cos i} \end{split}$$

Here we have

$$Y' = C'a'^2r'\frac{d^2\Omega'}{dr'dZ'}\cos i'$$

C' being the quantity so designated at page 78.

$$\begin{split} \mathrm{D}^{\prime\prime} &= \mathrm{C}^\prime \bigg[ a^{\prime 3} \frac{d^2 \Omega^\prime}{d Z^{\prime 2}} + \frac{e^\prime r^\prime \sin f^\prime}{\cos^3 \varphi^\prime} \frac{d \Omega^\prime}{d g^\prime} - \frac{\mathrm{i} + 2e^\prime \cos f}{\cos^4 \varphi^\prime} \frac{+ e^2}{a^\prime r^\prime} \frac{d \Omega^\prime}{d r^\prime} \bigg] \cos i^\prime \\ \mathrm{E}^{\prime\prime} &= - \mathrm{C}^\prime \frac{a^\prime}{r^\prime} \overline{\mathrm{T}}^\prime \\ \mathrm{H}^{\prime\prime} &= \mathrm{C}^\prime a^{\prime 2} a \frac{d^2 \Omega^\prime}{d Z d Z^\prime} \cos i^\prime \end{split}$$

By neglecting certain terms factored by sin2 J we can put

$$a'^{3}\frac{d^{2}\Omega'}{dZ^{2}} = -\mu'\left(\frac{\mathbf{a}'}{\triangle}\right)^{3} \qquad a'^{2}a\frac{d^{2}\Omega'}{dZdZ'} = \mu'\alpha\left[\left(\frac{\mathbf{a}'}{\triangle}\right)^{3} - \frac{\mathbf{I}}{\alpha^{3}}\left(\frac{\mathbf{a}}{r}\right)^{3}\right]$$

Of the factors involved in D" it is sufficient to put

$$\frac{e'r'\sin f'}{a'\cos^3\varphi'} \stackrel{\circ}{=} 2[8.4488]\sin g' + 2[6.8961]\sin 2g'$$

$$\frac{1 + 2e'\cos f' + e'^2}{\cos^4\varphi'} = [0.0014] + 2[8.7514]\cos g' + 2[7.50]\cos 2g'$$

In addition

$$\frac{1}{\alpha^3} \left(\frac{a}{r}\right)^3 = 6.192 + 0.895 \cos g + 0.065 \cos 2g + 0.005 \cos 3g$$

$$C'\frac{a'}{r'} = 2[9.6976] \sin (\gamma' - g') - 2[8.4478] \sin \gamma' + 2[8.4466] \sin (\gamma' - 2g') + 2[7.25] \sin (\gamma' - 3g')$$

In all these computations it is unnecessary to attend to the factor  $\cos i'$ , as it is intended to take the plane of the orbit at the epoch 1850 as the plane of reference, which makes  $i_0' = 0$ .

The following is the expression for  $\frac{D''}{C'}$ , the only quantity independent of  $\gamma'$  it is worth while to give:

| Arg=i'g'+ig                                |                                     | <u>y</u>  | Arg=i'g'+ig                                  | $rac{\mathrm{D}^{\prime\prime}}{\mathrm{C}^{\prime}}$ Arg= $\mathrm{i}^{\prime}g^{\prime}+\mathrm{i}g$      |   |  | <u>D''</u>   |   |  |
|--|-------------------------------------|---|--|--|---|--|--|---|--|
|  | cos.                                | sin.  |  | cos.   | sin.  |  | cos.   | sin.  |  |

The terms having the argument  $\nu'$  in  $\delta U'$  are important, as they determine the amount of the secular motion of the plane of the orbit due to the square and product of the masses of Jupiter and Saturn. The following detail of the composition of these terms is therefore given:

$$\frac{dU'}{dg'}n'\delta z' = -0.012147 \cos \gamma' - 0.007098 \sin \gamma'$$

$$\frac{dU'}{dg'}n\delta z = -0.004190 - 0.002847$$

$$U'\left(\nu' - 2\nu + 2c + \delta \frac{h'}{h_0'}\right) = +0.002876 + 0.002141$$

$$Y'(\nu' - c' - \nu + c) = -0.013664 - 0.008705$$

$$D''\frac{u'}{\cos i'} = +0.000950 + 0.000589$$

$$E''\frac{u_1'}{\cos i} = -0.003083 - 0.002182$$

$$H''\frac{u}{\cos i} = -0.00095 - 0.000065$$
Sum = -0.029353 cos \(\gamma' - 0.018167 \) \sin \(\gamma'

The following is the complete expression for  $\delta U'$ :

| $Arg = \varkappa \gamma' + i'g' + ig$  | δυ′   |  |  |  |  |  |  |

As in the case of Jupiter the only terms in the latitude of Saturn of three dimensions, which seem large enough to be taken account of, are the secular terms proportional to the cube of the time. According to Leverrier\* we have

```
\sin i' \sin \theta' = ... + 0.015774 \sin (126 5 44 - 25.89t)

\sin i' \cos \theta' = ... + 0.015774 \cos (126 5 44 - 25.89t)
```

But here  $\theta'$  is counted from the equinox of 1800.0. Adding therefore 41'53', the amount of precession for 50 years, the formulæ become

```
\sin i' \sin \theta' = ... + 0.015774 \sin (126 47 37 - 25.89t)

\sin i' \cos \theta' = ... + 0.015774 \cos (126 47 37 - 25.89t)
```

Whence we deduce that the sine of the latitude of Saturn, referred to the fixed ecliptic of 1850.0, contains the terms

$$\sin b' = -\circ''.000858T^3 \sin l' + \circ''.00064 T^3 \cos l'$$

<sup>\*</sup>Annales de l'Observatoire de Paris, Mémoires, Tome II, p. 157.

## CHAPTER XXVI.

FORMULÆ FOR THE MOTION OF THE PLANE OF THE ECLIPTIC AND FOR PRECESSION.

The subject announced in the title of this chapter properly belongs to the solar theory and the general stellar theory. But in order that the preceding theory may be compared, in a satisfactory manner, with observation, it is necessary to be able to reduce the theoretical positions of our planets to the moving planes of reference unavoidably employed by observers. The formulæ given by Leverrier or Hansen might be used for this purpose; but there is one imperfection attached to them: they are limited to the first and second powers of the time. On account of the lengthened series of observations we now possess it seems desirable to add to the formulæ the terms multiplied by the third power of the time. I have therefore made a partially independent investigation of this subject. The reader is, however, advised that this is only to serve a temporary purpose, and will be superceded when the solar theory, in other hands, shall have been finished.

Availing ourselves of the tables of the coefficients of the secular portion of the perturbative function given by Leverrier\*, the rate of motion of the ecliptic has been computed for the three epochs 1600, 1850, and 2100. Thence have been inferred the two equations giving the position of the ecliptic of any date with reference to that of 1850. The following details are all it is thought necessary to give of this work.

The elements of the planets involved in the computation are, for each of the three epochs, the following:

|           | Date.                  | e                                      | J   | П   | II'   | $\pi - \Pi'$                            |

With these values of the elements have been computed the values of the two functions

$$-\frac{d\left(\frac{a'}{\triangle}\right)}{dJ} \qquad -\frac{1}{\sin J} \left[\cos J \frac{d\left(\frac{a'}{\triangle}\right)}{dU} + \frac{d\left(\frac{a'}{\triangle}\right)}{dU'}\right]$$

(a' must be understood as belonging to the exterior of the two planets). The following are the results obtained:

|           | Date.                | , First function.                               | Second function.                             | 1         | Date.                | First function.                                 | Second function.                                |

In computing these quantities all the terms given by Leverrier have been employed. In the case of the action of Mars it was found that the terms of the fifth order, with respect to the eccentricities and inclination, amount to about one per cent.

of those of the first order, thus showing a lack of rapid convergence. Hence, it appears very desirable that the secular action of Mars on the Earth should be determined by the use of Gauss' method.

If we put the first of the two quantities just obtained, equal to  $k \cos K$ , and the second equal to  $k \sin K$ , the rate of motion of the ecliptic of date, in reference to the ecliptic of 1850.0, is given by the formulæ

$$\frac{d(\sin i \sin \theta)}{dt} = \frac{n}{\sqrt{1-e^2}} \frac{m'}{1+m} k \cos (\pi - \Pi' - K)$$

$$\frac{d(\sin i \cos \theta)}{dt} = -\frac{n}{\sqrt{1-e^2}} \frac{m'}{1+m} k \sin (\pi - \Pi' - \mathbf{K})$$

in the case of the action of an interior planet. For the action of an exterior planet  $\pi - \Pi$  is substituted for  $\pi - \Pi'$ . If the unit of t is the Julian year, and the coefficients are to be expressed in seconds of arc, we have, severally, for the three epochs:

| Date. | $\log\left(\frac{n}{\sqrt{1-e^2}}\frac{1}{1+m}\right)$ |
|-------|--|
| 1600  | 6. 1126579   |
| 1850  | 6. 1126572   |
| 2100  | 6. 1126564   |
|       | <u> </u>   |

It is now easy to find the action of each planet in changing the position of the plane of the ecliptic when the value of its mass is known. In the cases of Mercury, Venus, and Uranus the values here adopted differ somewhat from those given in Chapter I:

|                  | $\frac{1}{m'}$ | $\frac{d(\sini\sin\theta)}{dt}$ |                    |                      |  |
|------------------|----------------|---------------------------------|--------------------|----------------------|--|

From these data, adopting the century as the unit of time, it is easy to derive the following formulæ:\*

$$\sin i \sin \theta = + 5.2723\text{T} + 0.19501\text{T}^2 - 0.000240\text{T}^8$$
  
 $\sin i \cos \theta = - 46.7608\text{T} + 0.05666\text{T}^2 + 0.000506\text{T}^3$ 

Whence also

$$\cos i = 1 - [92.4155]T^2 + [89.58]T^3$$

In deriving suitable formulæ for precession we set out from the exceedingly simple differential equations first stated by Poisson

$$\frac{d\omega}{dt} = \frac{1}{\operatorname{C} n \, \sin \, \omega} \frac{d\mathrm{V}}{d\psi} \qquad \qquad \frac{d\psi}{dt} = -\frac{1}{\operatorname{C} n \, \sin \, \omega} \frac{d\mathrm{V}}{d\omega}$$

where

$$\nabla = -\frac{3}{2} \left( C - \frac{A + B}{2} \right) \left[ m' \frac{z'^2}{r'^5} + m'' \frac{z''^2}{r''^5} \right]$$

Here  $\omega$  denotes the inclination of the equator to a fixed plane,  $\psi$  the amount of backward motion of its node on this plane, A, B, and C are the moments of inertia of the Earth about its principal axes, C being supposed to belong to the axis of rotation, n is the angular velocity of this rotation, supposed constant, m' and m'' are the masses severally of the Sun and Moon, r' and r'' the distances of their centers from the center of the Earth, and z' and z'' the projection of these distances on a plane perpendicular to the equator. However, denoting by  $\delta'$  and  $\delta''$  the declinations of the two bodies, it is better to write V thus

$$V = -\frac{3}{2} \left(C - \frac{A + B}{2}\right) \left[\frac{m'}{r'^3} \sin^2 \delta' + \frac{m''}{r''^3} \sin^2 \delta''\right]$$

<sup>&</sup>quot;LEVERRIER'S value of the coefficient of  $T^2$ , in the expression for  $\sin i \sin \theta$ , +o''.1964 (Annales, Tome II, p. 104), appears to agree with that found here. But Hansen and Olufsen's value, +o''.1887 (Tables du Solei). p.  $^{2}$ 1), seems to be in error; at least I am unable otherwise to explain the discordance.

Were there a third body producing sensible motion in the axis of the Earth it would be only necessary to add to the last factor of V a term altogether similar to the two which are already there.

When we treat precession alone it suffices to substitute for the terms  $\frac{m'}{r'^3}\sin^2\delta' + \frac{m''}{r''^3}\sin^2\delta''$  their secular portions. In the case of the first of these, neglecting all periodic perturbations, we can assume that the Sun moves about the Earth in an ellipse whose elements are slowly changing. Assuming that the ecliptic of 1850.0 is the fixed plane of reference for the measurement of  $\omega$  and  $\psi$ , if  $\beta'$  and  $\lambda'$  denote the latitude and longitude of the Sun referred to the ecliptic and mean equinox of the same date, we have

$$\sin \delta' = \sin \beta' \cos \omega + \cos \beta' \sin \omega \sin (\lambda' + \psi)$$

But taking the orbit longitude l' of the Sun we have

25 AST-33

$$\cos \beta' \cos (\lambda' - \theta) = \cos (l' - \theta)$$

$$\cos \beta' \sin (\lambda' - \theta) = \cos i \sin (l' - \theta)$$

$$\sin \beta' = \sin i \sin (l' - \theta)$$

Here i and  $\theta$  denote the quantities which have been thus designated in the just concluded treatment of the motion of the ecliptic. By substituting these values in the equation for  $\sin \delta'$  we get

$$\sin \delta' = [\sin i \cos \omega + \cos i \sin \omega \cos (\psi + \theta)] \sin (l' - \theta) + \sin \omega \sin (\psi + \theta) \cos (l' - \theta)$$

From the theory of elliptic motion we know that  $\frac{a^3}{r^3}\cos 2f$  and  $\frac{a^3}{r^3}\sin 2f$  have no non-periodic terms. Thus, for  $\sin^2 \delta'$ , in the expression of V, one may substitute

$$\frac{1}{2}[\sin i \cos \omega + \cos i \sin \omega \cos (\psi + \theta)]^2 + \frac{1}{2}\sin^2 \omega \sin^2 (\psi + \theta)$$

and for  $\frac{a'^3}{r'^3}$  may be substituted its non-periodic term  $(1-e'^2)^{-\frac{3}{2}}$ . But calling the mean obliquity of date  $\omega'$ , and  $\psi'$  the general precession, the formulæ, which connect  $\omega'$ ,  $\psi'$  with  $\omega$ ,  $\psi$  are

$$\sin \omega' \sin (\psi' + \theta) = \sin \omega \sin (\psi + \theta)$$

$$\sin \omega' \cos (\psi' + \theta) = \sin i \cos \omega + \cos i \sin \omega \cos (\psi + \theta)$$

$$\cos \omega' = \cos i \cos \omega - \sin i \sin \omega \cos (\psi + \theta)$$

As the addition or subtraction of a function independent of  $\omega$  and  $\psi$  to V does not impair its use for our purposes, it is plain we may substitute for  $\sin^2 \delta'$ 

$$-\frac{1}{2}\cos^2\omega' = -\frac{1}{2}[\cos i\cos\omega - \sin i\sin\omega\cos(\psi + \theta)]^2$$

To ascertain the non-periodic part of  $\frac{\sin^2 \delta''}{r''^3}$  is more difficult, as the solar perturbations of the Moon have to be considered. However, some simplifications occur.

It is well known that the plane of the Moon's orbit follows the ecliptic in its motion. Then, if  $\beta''$  and  $\lambda'' + \psi'$  denote the latitude and longitude of the Moon referred to the ecliptic and mean equinox of date,

$$\sin \delta'' = \sin \beta'' \cos \omega' + \cos \beta'' \sin \omega' \sin (\lambda'' + \psi')$$

$$\frac{\sin^2 \delta''}{r''^3} = \frac{\sin^2 \beta''}{r''^3} \cos^2 \omega' + \frac{\sin^2 \beta''}{r''^3} \sin (\lambda'' + \psi') \sin \omega' \cos \omega'$$

$$+ \frac{1}{2} \frac{\cos^2 \beta''}{r''^3} \sin^2 \omega' - \frac{1}{2} \frac{\cos^2 \beta''}{r''^3} \cos 2(\lambda'' + \psi') \sin^2 \omega'$$

Now it is evident that the two terms of the last equation, which have the factors  $\sin(\lambda'' + \psi')$  and  $\cos 2(\lambda'' + \psi')$ , are wholly periodic, and thus may be rejected. Furthermore, from the expression we may subtract  $\frac{\sin^2 \beta''}{r''^3}$ , which does not contain  $\omega$  or  $\psi$ . Thus, for our purpose, we may substitute for  $\frac{\sin^2 \delta''}{r''^3}$ 

$$\frac{1}{2}\frac{1-3\sin^2\beta''}{r''^3}\sin^2\omega'$$

The non-periodic term of the first factor of this, corresponding to elliptic values for the co-ordinates, is readily discovered. For the non-periodic term of  $\frac{a''^3}{r''^3}$  is  $(\mathbf{1} - e''^2)^{-\frac{3}{2}}$ , and the orbit longitude and the longitude of the node of the Moon being denoted by l'' and  $\Omega''$  and its inclination by i''

$$\sin^2\beta^{\prime\prime} = \sin^2i^{\prime\prime}\,\sin^2(l^{\prime\prime} - \Omega^{\prime\prime}) = \frac{1}{2}\sin^2i^{\prime\prime} - \frac{1}{2}\sin^2i^{\prime\prime}\,\cos\,2(l^{\prime\prime} - \Omega^{\prime\prime})$$

But, as before mentioned,  $\frac{a''^3}{r''^3}\cos 2(l''-\Omega'')$  does not contain any non-periodic term. Hence, the non-periodic part of  $\frac{a''^3}{r''^3}(1-3\sin^2\beta'')$  is

$$(1 - e''^2)^{-\frac{3}{2}} (1 - \frac{3}{2} \sin^2 i'')$$

To obtain the terms of the constant part of this function, which arise from solar perturbation, we take from Pontécoulant\* the following terms of  $\frac{a''^3}{r''^3}$ :

$$\frac{a''^3}{r''^3} = (1 - e''^2)^{-\frac{3}{2}} + \frac{1}{2}m^2 - \frac{9}{3^2}m^4 + \frac{55}{16}m^5 + \frac{2159}{96}m^6 + \left[\frac{771}{128}m^2 + \frac{8145}{256}m^3 + \frac{681789}{4096}m^4\right]e''^2 + \left[\frac{3}{4}m^2 + \frac{153}{64}m^3 + om^4\right]e'^2 + \left[3m^2 + \frac{19}{2}m^3 + \frac{135}{6}me''^2\right]\cos 2\xi + 3e''\cos \varphi + \frac{45}{8}me''\cos (2\xi - \varphi)$$

<sup>\*</sup>Théorie Analytique du Système du Monde, Tome IV, pp. 216, 226, 303.

From the value of  $\sin^2 \beta''$  we have \*

$$\mathbf{I} - 3 \sin^2 \beta'' = \mathbf{I} - \frac{3}{2} \gamma^2 \left[ \mathbf{I} + \frac{9}{64} m^2 + \frac{141}{128} m^3 + \frac{7103}{2048} m^4 + \frac{771}{256} m^2 e''^2 + \frac{463}{64} m^2 e'^2 - \left( \frac{3}{4} m + \frac{3}{16} m^2 \right) \cos 2\xi + \frac{109}{16} m^2 e'' \cos \varphi + \frac{3}{2} m e'' \cos (2\xi - \varphi) \right]$$

By the multiplication of these factors it is found that the constant term of  $\frac{a''^3}{r''^3}$  (1 – 3 sin<sup>2</sup>  $\beta''$ ), which we denote by N, is

$$\begin{split} \mathbf{N} &= (\mathbf{1} - e^{t/2})^{-\frac{3}{2}} \left( \mathbf{1} - \frac{3}{2} \sin^2 i'' \right) + \frac{1}{2} m^2 - \frac{9}{32} m^4 + \frac{55}{16} m^5 + \frac{2159}{96} m^6 \\ &+ \left[ \frac{771}{128} m^2 + \frac{8145}{256} m^3 + \frac{681789}{4096} m^4 \right] e^{t/2} \\ &+ \left[ \frac{3}{4} m^2 + \frac{153}{64} m^3 + 0 m^4 \right] e^{t/2} \\ &- \left[ \frac{123}{128} m^2 - \frac{9}{256} m^3 + \frac{8853}{2048} m^4 \right] \gamma^2 \\ &- \frac{13329}{512} m^2 e^{t/2} \gamma^2 - \frac{1533}{128} m^2 e^{t/2} \gamma^2 \end{split}$$

This quantity may be regarded as absolutely constant, as e'2, the only symbol which varies in it, is multiplied by a small factor. However, if it is desired to consider its variability, the resultant term unites with the similar term arising from the action of the Sun, and the final formulæ are not rendered thereby more complex. On substitution of the numerical values of the quantities involved, it is found that at the epoch 1850

$$N = 0.9952929$$

It will be seen that the two terms of V involve severally the factors  $\frac{m'}{a''^3}$  and  $\frac{m''}{a''^3}$ . But it will be more convenient to replace them by the following equivalents:

$$\frac{m'}{a'^3} = \frac{m'}{m + m'} n'^2 \qquad \qquad \frac{m''}{a''^3} = \frac{m''}{m + m''} n''^2$$

where m denotes the mass of the Earth.

If, therefore, we put

$$\mathbf{H} = \frac{3}{4} \frac{\mathbf{C} - \frac{\mathbf{I}}{2}(\mathbf{A} + \mathbf{B})}{\mathbf{C}} \left[ \frac{m'}{m + m'} \frac{n'^2}{n^2} (\mathbf{I} - e'^2)^{-\frac{3}{2}} + \frac{m''}{m + m''} \frac{n''^2}{n^2} \mathbf{N} \right]$$

it will be perceived that this quantity is independent of the assumed units of measurement; moreover it is nearly constant, its variability arising from that of  $e'^2$ . It is sufficiently accurate to assume that it is of the form a + bt. If we put

$$\Omega = H \cos^2 \omega' = H [\cos i \cos \omega - \sin i \sin \omega \cos (\psi + \theta)]^2$$

our differential equations become

$$\frac{1}{n}\frac{d\omega}{dt} = \frac{1}{\sin \omega}\frac{d\Omega}{d\psi} \qquad \qquad \frac{1}{n}\frac{d\psi}{dt} = -\frac{1}{\sin \omega}\frac{d\Omega}{d\omega}$$

These equations fulfill the law of dimensions as the left members are the ratios of two angular velocities, and the right members also are functions of ratios. They can be written

$$\frac{d\omega}{dt} = 2 \operatorname{H} n \sin i \cos \omega' \sin (\psi + \theta)$$

$$\frac{d\psi}{dt} = 2 \operatorname{H} n \cos \omega' \left[\cos i + \sin i \cot \omega \cos (\psi + \theta)\right]$$

It is convenient to have differential equations determining  $\omega'$  and  $\psi'$  directly, and thus avoid the arriving at them through the mediation of  $\omega$  and  $\psi$ . It is plain from the preceding expressions for  $\Omega$  and the differential equations for  $\omega$  and  $\psi$  that the complete differential of  $\cos \omega'$  is equal to the partial differential of its equivalent in terms of  $\omega$  and  $\psi$  taken with respect to t as far as it is implicitly involved. This gives

$$\frac{d \cdot \cos \omega'}{dt} = -\left[\sin i \cos \omega + \cos i \sin \omega \cos (\psi + \theta)\right] \frac{di}{dt} + \sin i \sin \omega \sin (\psi + \theta) \frac{d\theta}{dt}$$
$$= -\sin \omega' \cos (\psi' + \theta) \frac{di}{dt} + \sin i \sin \omega' \sin (\psi' + \theta) \frac{d\theta}{dt}$$

Consequently

$$\frac{d\omega'}{dt} = \cos \left(\psi' + \theta\right) \frac{di}{dt} - \sin i \sin \left(\psi' + \theta\right) \frac{d\theta}{dt}$$

In order to arrive at an expression for  $\frac{d\psi'}{dt}$ , we differentiate the first of the equations which show the relation of  $\omega'$ ,  $\psi'$  to  $\omega$ ,  $\psi$ . Thus

$$\cos \omega' \sin (\psi' + \theta) d\omega' + \sin \omega' \cos (\psi' + \theta) (d\psi' + d\theta) = \cos \omega \sin (\psi + \theta) d\omega + \sin \omega \cos (\psi + \theta) (d\psi + d\theta)$$

Substituting in the right member of this the values of  $d\omega$  and  $d\psi$  which have been just given, it reduces to

$$_2$$
H $_n \sin \omega' \cos \omega' \cos (\psi' + \theta)dt + [\cos i \sin \omega' \cos (\psi' + \theta) - \sin i \cos \omega']d\theta$ 

Also employing the valve of  $d\omega'$ , previously given, the equation is transformed into

$$\sin \omega' \cos (\psi' + \theta) d\psi' = 2 \operatorname{H} n \sin \omega' \cos \omega' \cos (\psi' + \theta) dt - \cos \omega' \sin (\psi' + \theta) \cos (\psi' + \theta) di$$
$$- \left[ 2 \sin^2 \frac{i}{2} \sin \omega' \cos (\psi' + \theta) + \sin i \cos \omega' - \sin i \cos \omega' \sin^2 (\psi' + \theta) \right] d\theta$$

Whence we derive

$$\frac{d\psi'}{dt} = 2 \operatorname{H} n \cos \omega' - \cot \omega' \sin (\psi' + \theta) \frac{di}{dt} - \left[ 2 \sin^2 \frac{i}{2} + \sin i \cot \omega' \cos (\psi' + \theta) \right] \frac{d\theta}{dt}$$

The expressions for  $\frac{d\omega'}{dt}$  and  $\frac{d\psi'}{dt}$  can be simplified by putting

$$k \cos K = -\sin \theta \frac{di}{dt} - \sin i \cos \theta \frac{d\theta}{dt} = -\frac{dp}{dt} - p \tan \frac{i}{2} \frac{di}{dt}$$
$$k \sin K = \cos \theta \frac{di}{dt} - \sin i \sin \theta \frac{d\theta}{dt} = \frac{dq}{dt} + q \tan \frac{i}{2} \frac{di}{dt}$$

where p and q have the usual significations

$$p = \sin i \sin \theta \qquad q = \sin i \cos \theta$$

Then the two differential equations take the form

$$\begin{split} \frac{d\omega'}{dt} &= k \sin (\psi' + K) \\ \frac{d\psi'}{dt} &= {}_{2} Hn \cos \omega' - {}_{2} \sin^{2} \frac{i}{2} \frac{d\theta}{dt} + k \cot \omega' \cos (\psi' + K) \end{split}$$

They are readily integrated in powers of the time by the use of Maclaurin's Theorem. Let us suppose that at the epoch 1850.0 we have  $\omega' = 23^{\circ}27'31''.83$ ,  $\frac{d\psi'}{dT} = 5025''.787$ . 2Hn is diminishing at the rate of 0''.003656 in a century. The term  $-2 \sin^2 \frac{i}{2} \frac{d\theta}{dT}$ , which is excessively small, is equivalent to  $+0''.000023T^2$ . With these have been calculated, at intervals of 500 years, the following quantities:

| Date.                               | $\log k$   | K  | æ′  | $\psi'$  |
|-------------------------------------|--|--|---|--|
| 850<br>1350<br>1850<br>2350<br>2850 | 1. 6790634 1. 6758217 1. 6726250 1. 6694575 1. 6663071 | 268 26 24.02<br>266 0 11.29<br>263 34 1.36<br>261 7 42.41<br>258 41 0.53 | 23 35 16.72<br>23 31 25.20<br>23 27 31.83<br>23 23 38.08<br>23 19 45.42 | 0 ' " -13 55 46.39 - 6 58 21.06 0 0 0.00 + 6 59 16.80 +13 59 29.35 |

The rates of motion of  $\omega'$  and  $\psi'$  can be obtained from the differential equations. They are

| Date. | $rac{d\omega'}{d\Gamma}$               | $rac{d\psi'}{d\mathbf{T}}$ |
|-------|---|-----------------------------|
| i     | ,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,, | ,,                          |
| 850   | -46. 02522                              | +5003. 78451                |
| 1350  | 46. 53860                               | 5014. 73750                 |
| 1850  | 46. 76080                               | 5025. 78700                 |
| 2350  | 46. 68988                               | 5036. 86128                 |
| 2850  | 46. 32694                               | +5047.88573                 |

From these quantities are inferred the formulæ

$$\begin{aligned} \omega' &= 23^{\circ}27'31''.83 - 46''.7608T - o''.00757T^2 + o''.001956T^3 \\ \psi' &= 5025''.7870T + 1''.10739T^2 + o''.000174T^3 - o''.0000488T^4 - o''.0000023T^5 \end{aligned}$$

which substantially give again the values of  $\omega'$  and  $\psi'$  employed in computing the rates of motion.

## CHAPTER XXVII.

REFERENCE OF THE LONGITUDES AND LATITUDES OF JUPITER AND SATURN TO THE MEAN EQUINOX AND ECLIPTIC OF DATE.

In order to have the greatest simplicity in the formulæ we assume, in the case of each planet, the mean plane of its orbit at the epoch 1850.0 as the plane from which its latitude in the first instance is to be counted. In the interval, 1600-2100, that is, 250 years on each side of the epoch, the maximum latitude of Jupiter, referred thus to its plane, will be about 40''; the similar quantity for Saturn will be about 58''. Thus we can put  $\cos i = 1$ ,  $\cos b = 1$  whenever they multiply quantities of the order of the disturbing forces. Then, in Hansen's equations  $(21)^*$ , we have  $i_0 = 0$ , n = 2, and they become

$$\cos b \sin (l - \theta_0 - \Gamma) = \sin (f + \pi - \theta_0) - \frac{1}{2} sq$$

$$\cos b \cos (l - \theta_0 - \Gamma) = \cos (f + \pi - \theta_0) + \frac{1}{2} sp$$

$$\sin b = s$$

From these we derive

$$\cos b \sin (l - f - \pi - \Gamma) = -\frac{1}{2} sq \cos (f + \pi - \theta_0) - \frac{1}{2} sp \sin (f + \pi - \theta_0)$$

$$\cos b \cos (l - f - \pi - \Gamma) = 1 + \frac{1}{2} sp \cos (f + \pi - \theta_0) - \frac{1}{2} sq \sin (f + \pi - \theta_0)$$

But

$$p \cos (v - \theta_0) - q \sin (v - \theta_0) = -s$$

$$q \cos (v - \theta_0) + p \sin (v - \theta_0) = \frac{ds}{dr}$$

Consequently

$$\cos b \cos (l - f - \pi - \Gamma) = \mathbf{1} - \frac{1}{2}s^2$$
$$\cos b \sin (l - f - \pi - \Gamma) = -\frac{1}{2}s\frac{ds}{dv}$$

Neglecting terms of the fourth order with respect to disturbing forces these equations give

$$l = f + \pi + \Gamma - \frac{1}{2}s\frac{ds}{dv}$$

<sup>\*</sup>Auseinandersetzung, Abth. I, s. 79.

Thus,  $f + \pi$  denoting the amount of description of angle by the radius vector, the two latter terms of the equation represent the reduction required to refer this angle to the chosen fixed plane.

Since  $s = \frac{a_0}{r}u$ , for the computation of  $\Gamma$ , we have\*

$$\Gamma = \frac{1}{2 \cos \varphi_0} \int a_0^2 \frac{d\Omega}{dZ} u n dt$$

The second term of the reduction can be made to undergo the following transformations:

$$-\frac{1}{2} \frac{ds}{dv} = -\frac{1}{4} \frac{\vec{r}^2 (1+\nu)^2}{a^2 \cos \varphi} \frac{d \cdot s^2}{n dt} = -\frac{1}{4} \frac{\vec{r}^2}{a^2 \cos \varphi} \frac{d \cdot \left(\frac{a^2}{r^2} u^2\right)}{n dt}$$
$$= -\frac{1}{4 \cos \varphi} \left[ \frac{d \cdot u^2}{n dt} - 2 \frac{d \cdot \log \vec{r}}{n dt} \cdot u^2 \right]$$

In the case of Jupiter it is found that the largest terms of  $\Gamma$  are

$$\Gamma = -0''.0001 \sin(5g' - 2g) - 0''.0002 \cos(5g' - 2g)$$

it is therefore quite insignificant. For the second term it is sufficient to take

$$u^{2} = + 0.00000023n^{2}t^{2} - 0.00000015n^{2}t^{2} \cos(-2g) + 0.00000017n^{2}t^{2} \sin(-2g)$$

$$\frac{d \cdot u^{2}}{ndt} = + 0.00000046nt - 0.00000030n^{2}t^{2} \sin(-2g) - 0.00000034n^{2}t^{2} \cos(-2g)$$

Thence, with sufficient approximation,

$$-\frac{1}{2}s\frac{ds}{dv} = + \circ''.000000075n^2t^2\sin(-2g) + \circ''.000000083n^2t^2\cos(-2g)$$

In the case of Saturn we have

$$\Gamma' = + \frac{('') \cos \cos \cos \cos \cos \sin t^{2}}{\sin (g' - g) - \cos \cos \cos t^{2}t} \cos (g' - g) + \frac{('') \cos (g' - g)}{\cos \cos t^{2}t} \sin (g' - g) + \frac{('') \cos (g' - g)}{\cos (g' - g)} + \frac{('') \cos (g'$$

Let i denote the inclination of the plane of the primitive orbit on the ecliptic of date, and  $\theta$  the longitude of its ascending node, counted on the plane of the primitive orbit from the same point of departure as for l, and  $\Omega$  the longitude of the same node, counted on the plane of the ecliptic of date from the mean equinox of date. Then, if  $\lambda$  and  $\beta$  denote the longitude and latitude of the planet referred to the mentioned equinox and ecliptic, we shall have

$$\sin \beta = \cos i \sin b + \sin i \cos b \sin (l - \theta)$$

$$\cos \beta \sin (\lambda - \Omega) = -\sin i \sin b + \cos i \cos b \sin (l - \theta)$$

$$\cos \beta \cos (\lambda - \Omega) = \cos b \cos (l - \theta)$$

In these equations i,  $\theta$ , and  $\Omega$  depend only on  $i_0$ ,  $\theta_0$ , the values of i and  $\theta$  for the epoch 1850.0, and on the quantities which determine the position of the ecliptic of date with respect to the ecliptic of the epoch. If the change in the measure of orbit longitudes is denoted by  $\Omega - \theta_0 + \alpha$  the foregoing equations may be written

$$\sin \beta = \cos i \sin b + \sin i \cos b \sin (l - \theta_0 + \alpha)$$

$$\cos \beta \sin (\lambda - \Omega) = -\sin i \sin b + \cos i \cos b \sin (l - \theta_0 + \alpha)$$

$$\cos \beta \cos (\lambda - \Omega) = \cos b \cos (l - \theta_0 + \alpha)$$

The three quantities, i,  $\alpha$ , and  $\alpha$ , are determined by the equations

$$\sin i \cos (\Omega - \theta'' - \psi') = -\sin i'' \cos i_0 + \cos i'' \sin i_0 \cos (\theta'' - \theta_0)$$

$$\sin i \sin (\Omega - \theta'' - \psi') = -\sin i_0 \sin (\theta'' - \theta_0)$$

$$\cos i = \cos i'' \cos i + \sin i'' \sin i_0 \cos (\theta'' - \theta_0)$$

$$\sin i \cos \alpha = \sin i_0 \cos i'' - \cos i_0 \sin i'' \cos (\theta'' - \theta_0)$$

$$\sin i \sin \alpha = \sin i'' \sin (\theta'' - \theta_0)$$

where i'' and  $\theta''$  are the quantities denoted as i and  $\theta$  in the preceding chapter, and there used to determine the position of the ecliptic of date with respect to the ecliptic of 1850.0;  $\psi'$  denotes the general precession. For the first two of these equations we may substitute

$$\sin i \cos (\Omega - \theta_0 - \psi') = \sin i_0 - \cos i_0 \sin i'' \cos (\theta'' - \theta_0) - z \sin i_0 \sin^2 \frac{1}{z} i'' \cos^2 (\theta'' - \theta_0)$$

$$\sin i \sin (\Omega - \theta_0 - \psi') = -\cos i_0 \sin i'' \sin (\theta'' - \theta_0) - \sin i_0 \sin^2 \frac{1}{z} i'' \sin z (\theta'' - \theta_0)$$

and instead of computing  $\alpha$  it will be more accurate to derive  $\Omega - \theta_0 + \alpha - \psi'$ , which is a very small angle. By putting

$$\gamma = -\cos i_0 \sin i'' \cos (\theta'' - \theta_0) - \sin i_0 \sin^2 \frac{1}{2} i'' [\tau + \cos^2 (\theta'' - \theta_0)]$$

$$\delta = \cos^2 \frac{1}{2} i_0 \sin i'' \sin (\theta'' - \theta_0) + \sin i_0 \sin^2 \frac{1}{2} i'' \sin 2(\theta'' - \theta_0)$$

$$\epsilon = -2 \sin i_0 \sin^2 \frac{1}{2} i'' \sin^2 (\theta'' - \theta_0)$$

$$\zeta = 2 \sin^2 \frac{1}{2} i_0 \sin i'' \sin (\theta'' - \theta_0) - \sin i_0 \sin^2 \frac{1}{2} i'' \sin 2(\theta'' - \theta_0)$$

we can write

$$\sin i \cos (\Omega - \theta_0 - \psi') = \sin i_0 + \gamma - \frac{1}{2}\varepsilon$$

$$\sin i \sin (\Omega - \theta_0 - \psi') = -\delta + \frac{1}{2}\zeta$$

$$\sin i \cos \alpha = \sin i_0 + \gamma + \frac{1}{2}\varepsilon$$

$$\sin i \sin \alpha = \delta + \frac{1}{2}\zeta$$

From these four equations we derive

$$\sin^2 i \sin (\Omega - \theta_0 + \alpha - \psi') = \zeta \sin i_0 + \gamma \zeta - \delta \epsilon$$

whence, since  $\Omega - \theta_0 + \alpha - \psi'$  is so small an angle,

$$\Omega - \theta_0 + \alpha - \psi' = \frac{\zeta \sin i_0 + \gamma \zeta - \delta \varepsilon}{\sin^2 i}$$

In the equation which gives the value of  $\sin \beta$  we can put  $\cos b = 1$ , since it is multiplied by the small factor  $\sin i$ . Thus

$$\sin \beta = \cos i \sin b + \sin i \sin (l - \theta_0 + \alpha)$$

For convenience of tabulation we shall separate  $\beta$  into two parts, so that  $\beta = \beta_0 + \Delta \beta$ , where  $\beta_0$  will be obtained from the formula

$$\sin \beta_0 = A \sin l + B \cos l$$

A and B being expressible in powers of the time. In doing this we shall remove from the term  $\cos i \sin b$  the portion which can be regarded as a function of the same form as  $\sin \beta_0$ , and unite it with the latter. Let what is left of  $\sin b = s = \frac{a}{\bar{r}}u$ , after this removal, be denoted as  $\Delta(\sin b)$ . Then  $\Delta\beta$ , being purely periodic and amounting at most to a few seconds, is given with sufficient exactness by the formula

$$\Delta \beta = \frac{\cos i}{\cos \beta_0} \Delta(\sin b) = \frac{\cos i}{\cos \beta_0} \Delta \begin{pmatrix} a \\ \bar{r} u \end{pmatrix}$$

By putting

$$p'' = \sin i'' \sin \theta''$$
  $q'' = \sin i'' \cos \theta''$ 

quantities which have been determined in the preceding chapter, we can write the formula for the latitude in either of the two forms

$$\sin \beta = \cos i \sin b + \left[ \sqrt{1 - p''^2 - q''^2} \sin i_0 - p'' \cos i_0 \sin \theta_0 - q'' \cos i_0 \cos \theta_0 \right] \sin (l - \theta_0) + \left[ p'' \cos \theta_0 - q'' \sin \theta_0 \right] \cos (l - \theta_0)$$

$$=\cos i \sin b + \left[ \sqrt{1 - p''^2 - q''^2} \sin i_0 \cos \theta_0 + p'' \sin^2 \frac{1}{2} i_0 \sin 2\theta_0 - q'' (\cos i_0 \cos^2 \theta_0 + \sin^2 \theta_0) \right] \sin l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin i_0 \sin \theta_0 + p'' (\cos^2 \theta_0 + \cos i_0 \sin^2 \theta_0) - q'' \sin^2 \frac{1}{2} i_0 \sin 2\theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin i_0 \sin \theta_0 + p'' (\cos^2 \theta_0 + \cos i_0 \sin^2 \theta_0) - q'' \sin^2 \frac{1}{2} i_0 \sin 2\theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin i_0 \sin \theta_0 + p'' (\cos^2 \theta_0 + \cos i_0 \sin^2 \theta_0) - q'' \sin^2 \frac{1}{2} i_0 \sin 2\theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin i_0 \sin \theta_0 + p'' (\cos^2 \theta_0 + \cos i_0 \sin^2 \theta_0) - q'' \sin^2 \frac{1}{2} i_0 \sin 2\theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin i_0 \sin \theta_0 + p'' (\cos^2 \theta_0 + \cos i_0 \sin^2 \theta_0) - q'' \sin^2 \frac{1}{2} i_0 \sin 2\theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin i_0 \sin \theta_0 + p'' (\cos^2 \theta_0 + \cos i_0 \sin^2 \theta_0) - q'' \sin^2 \frac{1}{2} i_0 \sin 2\theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin i_0 \sin \theta_0 + p'' (\cos^2 \theta_0 + \cos i_0 \sin^2 \theta_0) - q'' \sin^2 \frac{1}{2} i_0 \sin 2\theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin i_0 \sin \theta_0 + p'' (\cos^2 \theta_0 + \cos i_0 \sin^2 \theta_0) - q'' \sin^2 \frac{1}{2} i_0 \sin 2\theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin i_0 \sin \theta_0 + p'' (\cos^2 \theta_0 + \cos i_0 \sin^2 \theta_0) - q'' \sin^2 \theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin^2 \theta_0 + p'' \cos^2 \theta_0 + \cos^2 \theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin^2 \theta_0 + p'' \cos^2 \theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin^2 \theta_0 + p'' \cos^2 \theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin^2 \theta_0 + p'' \cos^2 \theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin^2 \theta_0 + p'' \cos^2 \theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin^2 \theta_0 + p'' \cos^2 \theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin^2 \theta_0 + p'' \cos^2 \theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin^2 \theta_0 + p'' \cos^2 \theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin^2 \theta_0 + p'' \cos^2 \theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin^2 \theta_0 + p'' \cos^2 \theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin^2 \theta_0 + p'' \cos^2 \theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin^2 \theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin^2 \theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin^2 \theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin^2 \theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin^2 \theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin^2 \theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin^2 \theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 - q''^2} \sin^2 \theta_0 \right] \cos l + \left[ -\sqrt{1 - p''^2 -$$

The rigorous equation, which gives the value of  $\sin b$ , being

$$\sin b = \frac{r_0}{r} \int \frac{a_0 n_0 dt}{\sqrt{1 - e_0^2}} r_0 \sin (\vec{f} - f) \left[ \frac{d\Omega}{dZ} + \frac{r^2 + r r_0 + r_0^2}{r_0^3 r^2} \delta r \sin b \right]$$

where  $r_0$  and f denote elliptic values and f an f which is constant in the integration, it is easy to see that the constant factor, which multiplies the force, is

$$\frac{m'}{1+m}\alpha^2\left(\frac{a_0}{a}\right)^3\sin J$$

But the factor actually employed in the determination of u was

$$\frac{m'}{1+m}\alpha^2\frac{a_0}{a}\sin J$$

Hence, in deriving  $\sin b$  from u, we ought to multiply the latter by

$$\left(\frac{a_0}{a}\right)^2 \frac{a}{\bar{r}}$$

We have severally in the cases of Jupiter and Saturn

$$\log\left(\frac{a_0}{a}\right)^2 = 0.0000085 \qquad \log\left(\frac{a_0'}{a'}\right)^2 = 9.9996292$$

From the equations connecting  $\lambda$  and  $\beta$  with l and b there is obtained, with a sufficient degree of approximation,

$$\lambda - l - \Omega + \theta_0 - \alpha = -\tan^2 \frac{1}{2} i \sin 2 (l - \theta_0 + \alpha) + \frac{1}{2} \tan^4 \frac{1}{2} i \sin 4 (l - \theta_0 + \alpha)$$
$$- 2 \tan \frac{1}{2} i \tan b \cos (l - \theta_0 + \alpha) + 2 \tan^3 \frac{1}{2} i \tan b \cos 3 (l - \theta_0 + \alpha)$$

By substituting in this the value, which has been obtained for  $\Omega - \theta_0 + \alpha - \psi'$ , we get

$$\lambda = l + \psi' + \frac{\zeta \sin i_0 + \gamma \zeta - \delta \varepsilon}{\sin^2 i} - \tan^2 \frac{1}{2} i \sin 2 (l - \theta_0 + \alpha) + \frac{1}{2} \tan^4 \frac{1}{2} i \sin 4 (l - \theta_0 + \alpha)$$
$$- 2 \tan \frac{1}{2} i \tan b \cos (l - \theta_0 + \alpha) + 2 \tan^3 \frac{1}{2} i \tan b \cos 3 (l - \theta_0 + \alpha)$$

The part of the second line of this formula, which depends on the portion  $\Delta(\sin b)$  of  $\sin b$ , is, with sufficient approximation,

$$-\frac{\sin i}{\cos \beta_0} \Delta (\sin b) \cos (l - \theta_0 + \alpha) = -\tan i \cdot \Delta \beta \cdot \cos (l - \theta_0 + \alpha)$$

For the remainder of  $\sin b$ , which can be regarded as identical with  $\tan b$ , we can write

$$\tan b = A \sin (l - \theta_0 + \alpha) + B \cos (l - \theta_0 + \alpha)$$

A and B being expressible in powers of the time. Substituting this value in the last line of the equation for  $\lambda$  it becomes

$$- B \tan \frac{i}{2} - A \tan \frac{i}{2} \left( x + \tan^2 \frac{i}{2} \right) \sin 2 (l - \theta_0 + \alpha) + A \tan^3 \frac{i}{2} \sin 4 (l - \theta_0 + \alpha)$$

$$- B \tan \frac{i}{2} \left( x - \tan^2 \frac{i}{2} \right) \cos 2 (l - \theta_0 + \alpha) + B \tan^3 \frac{i}{2} \cos 4 (l - \theta_0 + \alpha)$$

If, therefore, we adopt two new quantities I and  $\eta$ , such that

$$\tan^2 \frac{1}{2} I \cos 2\eta = \tan^2 \frac{i}{2} + A \tan \frac{i}{2} \left( I + \tan^2 \frac{i}{2} \right)$$
$$\tan^2 \frac{1}{2} I \sin 2\eta = B \tan \frac{i}{2} \left( I - \tan^2 \frac{i}{2} \right)$$

which may be replaced by the equations

$$\sin I \cos \eta = \sin i + A \cos i$$
  
 $\sin I \sin \eta = B \cos i$ 

the equation for  $\lambda$  can be written

$$\lambda = l + \psi' + \frac{\zeta \sin i_0 + \gamma \zeta - \delta \varepsilon}{\sin^2 i} - B \tan \frac{i}{2} - \tan^2 \frac{1}{2} I \sin 2 (l - \theta_0 + \alpha + \eta)$$
$$+ \frac{1}{2} \tan^4 \frac{1}{2} I \sin 4 (l - \theta_0 + \alpha + \eta)$$
$$- \tan i \cdot \Delta \beta \cos (l - \theta_0 + \alpha)$$

As the tabulation of perturbations, both secular and periodic, for a fourth co-ordinate, the reduction to the ecliptic, appears a work of supererogation, we will give a method by which it can be avoided. Let the equation for  $\lambda$  be written

$$\lambda = f + \pi + ht - \tan^2 \frac{1}{2}i_0 \sin 2 (f + \pi - \theta_0) + \frac{1}{2}\tan^4 \frac{1}{2}i_0 \sin 4 (f + \pi - \theta_0) + \delta R$$

In this formula ht denotes the term, proportional to the first power of the time, in the development of the expression

$$\psi' + \frac{\zeta \sin i_0 + \gamma \zeta - \delta \varepsilon}{\sin^2 i} - B \tan \frac{i}{2}$$

in powers of the time; and  $\delta R$  denotes the remainder of this expression plus the secular and periodic perturbations of what is generally known as the reduction to the ecliptic. If we do not go beyond 300 years from the epoch,  $\delta R$ , for either Jupiter or Saturn, scarcely exceeds 10". Quantities dependent on its square may then be neglected. We have

$$\frac{dz}{d\lambda} = \frac{a^2n \cos \varphi \cos i_0}{F^2 \cos^2 \beta_0}$$

Consequently, if we equate the argument  $g + n\delta z$  by applying to it the correction

$$\Delta(n\delta z) = \frac{\bar{r}^2 \cos^2 \beta_0}{a^2 \cos \varphi \cos i_0} \delta \mathbf{R}$$

we shall obtain the proper value of  $\lambda - \pi - ht$  by entering a table calculated for this quantity, but in which the term  $\delta R$  has been ignored.  $\Delta(n\delta z)$  is a quantity which can be developed as a function of g and g', and having precisely the same form as  $n\delta z$ , its addition in nowise complicates the latter quantity; the only change being that some of the coefficients are modified by trifling amounts.

On account of this modification of the fundamental argument the expressions for  $\nu$  and  $\beta_0$  must receive corrections. The correction for  $\nu$  is

$$\Delta \nu = -\frac{d \cdot \log r}{dg} \Delta(n\delta z) = \left[ e \sin g - \frac{3}{2} e^2 \sin 2g \right] \Delta(n\delta z)$$

The correction to  $\sin \beta_0$  is

$$\Delta(\sin \beta_0) = -\frac{d(\sin \beta_0)}{dg}\Delta(n\delta z) = -\tan i \cos^2 \beta_0 \cos (f + \pi - \theta_0) \cdot \delta R$$

These corrections are quite minute.

Application of the formulæ to Jupiter.

Supposing that

$$A \sin f + B \cos f$$

are the terms to be removed from  $\cos i \sin b$ , we have, for determining  $\Delta \beta$ ,

$$\Delta\beta = \frac{\cos i}{\cos \beta_0} \frac{a_0^2}{a^2} \frac{a}{\bar{r}} u - A \frac{\sin f}{\cos \beta_0} - B \frac{\cos f}{\cos \beta_0}$$

A and B can be determined so that no terms of the form  $kT \sin g + k'T \cos g$  appear in  $\Delta \beta$ . From special values computed for eight points of the circumference at two epochs, using elliptic values of the co-ordinates augmented by the secular terms, it is found that

$$\frac{a_0^2}{a^2} \frac{a}{r} \frac{\cos i}{\cos \beta_0} = 0.9998907 - 0.0000077T$$

$$+ [ 0.0482118 + 0.0000010T] \cos g$$

$$+ [ 0.0000010 + 0.0000002T] \sin g$$

$$+ [ 0.0024471 + 0.0000098T] \cos 2g$$

$$+ [ -0.0000134 + 0.0000072T] \sin 2g$$

$$+ [ 0.0001444 - 0.0000015T] \cos 3g$$

$$+ [ -0.0000014 + 0.0000015T] \sin 3g$$

$$+ [ 0.0000138 - 0.0000031T] \cos 4g$$

In this expression g ought to be replaced by  $g + n\delta z$ ; it is sufficient to take for  $n\delta z$  the two terms having the arguments 5g' - 2g and 5g' - 3g. The additional terms, which thus should be joined to the expression, are

+ 0.0000554 
$$\cos (5g' - g) - 0.0001298 \sin (5g' - g)$$
  
- 0.0000188  $\cos (5g' - 2g) - 0.000012 \sin (5g' - 2g)$   
- 0.0000554  $\cos (5g' - 3g) + 0.0001298 \sin (5g' - 3g)$   
+ 0.0000188  $\cos (5g' - 4g) + 0.000012 \sin (5g' - 4g)$ 

In a similar way have been obtained the two expressions

$$\frac{\sin f}{\cos \beta_0} = \\ + 0.000001 - 0.0001796T \\ [0.998031 - 0.0000160T] \sin g + [-0.000007 - 0.0000185T] \cos g \\ + [0.048106 + 0.0001633T] \sin 2g + [-0.000002 - 0.000180T] \cos 2g \\ + [0.002674 + 0.0000169T] \sin 3g + [-0.000007 - 0.0000185T] \cos 3g \\ + [0.000159 + 0.0000015T] \sin 4g + [-0.000001 - 0.000016T] \cos 4g \\ + 0.001146 \sin (5g' - g) + 0.0002687 \cos (5g' - g) \\ - 0.000388 \sin (5g' - 2g) + 0.000244 \cos (5g' - 2g) \\ + 0.001146 \sin (5g' - 3g) + 0.002687 \cos (5g' - 3g) \\ - 0.000388 \sin (5g' - 4g) + 0.00024 \cos (5g' - 4g) \\ \\ \frac{\cos f}{\cos \beta_0} = \\ - 0.048252 - 0.0001648T \\ + [0.997577 - 0.0000196T] \cos g + [-0.000007 + 0.0000159T] \sin g \\ + [0.048094 + 0.0001630T] \cos 2g + [-0.000007 + 0.0001780T] \sin 2g \\ + [0.002672 + 0.000014T] \cos 3g + [-0.000007 + 0.0000203T] \sin 3g \\ + [0.000159 + 0.000014T] \cos 4g + [-0.000001 + 0.0000017T] \sin 4g \\ + 0.001145 \cos (5g' - g) - 0.002686 \sin (5g' - g) \\ - 0.000388 \cos (5g' - 2g) - 0.000024 \sin (5g' - 2g) \\ - 0.001145 \cos (5g' - 3g) + 0.002686 \sin (5g' - 3g) \\ + 0.000388 \cos (5g' - 4g) + 0.0002686 \sin (5g' - 4g) \\ + 0.000388 \cos (5g' - 4g) + 0.0002686 \sin (5g' - 4g) \\ + 0.000388 \cos (5g' - 4g) + 0.000264 \sin (5g' - 4g) \\ + 0.000388 \cos (5g' - 4g) + 0.000264 \sin (5g' - 4g) \\ + 0.000388 \cos (5g' - 4g) + 0.000264 \sin (5g' - 4g) \\ + 0.000388 \cos (5g' - 4g) + 0.000264 \sin (5g' - 4g) \\ + 0.000388 \cos (5g' - 4g) + 0.000264 \sin (5g' - 4g) \\ + 0.000388 \cos (5g' - 4g) + 0.000264 \sin (5g' - 4g) \\ + 0.000388 \cos (5g' - 4g) + 0.000264 \sin (5g' - 4g) \\ + 0.000388 \cos (5g' - 4g) + 0.000264 \sin (5g' - 4g) \\ + 0.000388 \cos (5g' - 4g) + 0.000264 \sin (5g' - 4g) \\ + 0.000388 \cos (5g' - 4g) + 0.000264 \sin (5g' - 4g) \\ + 0.000388 \cos (5g' - 4g) + 0.000264 \sin (5g' - 4g) \\ + 0.000388 \cos (5g' - 4g) + 0.000264 \sin (5g' - 4g) \\ + 0.000388 \cos (5g' - 4g) + 0.000264 \sin (5g' - 4g) \\ + 0.000388 \cos (5g' - 4g) + 0.000264 \sin (5g' - 4g) \\ + 0.000388 \cos (5g' - 4g) + 0.000264 \sin (5g' - 4g) \\ + 0.000388 \cos (5g' - 4g) + 0.000264 \sin (5g' - 4g) \\ + 0.000388 \cos (5g' - 4g) + 0.000264 \sin (5g' - 4g) \\ + 0.000388 \cos (5g' - 4g) + 0.000024 \sin (5g' - 4g) \\ + 0.000388 \cos (5g' - 4g) + 0.000264 \sin (5g' - 4g) \\ + 0.000388 \cos (5g' - 4g) + 0.000024 \sin (5g' - 4g$$

Adding together all the first-order terms with those of the second order, and changing the parts of the coefficients multiplied by nt and  $n^2t^2$  into the equivalents having the factors T and T<sup>2</sup>, we have the expression for u, which it is suitable to employ here. The equations, which then result for determining A and B, are

$$A[ 0.998031 - 0.0000160T] + B[ -0.000007 + 0.0000159T] = -14.6842T - 0.04638T^{2}$$

$$A[ -0.000007 - 0.0000185T] + B[ 0.997577 - 0.0000196T] = 6.5083T - 0.09804T^{2}$$

Whence we derive

$$A = - 14.7132T - 0.04681T^{2}$$

$$B = + 6.5240T - 0.09842T^{2}$$

Since  $f = l - 11^{\circ}$  56' 9".33, as far as these terms are concerned, we have, in joining to them the terms of the third order, obtained at the end of Chapter XXIV,

$$\cos i \sin b = [-13.0458T - 0.06615T^{2} + 0.000324T^{3}] \sin l + [9.4259T - 0.08661T^{2} - 0.000240T^{3}] \cos l$$

By employing the expressions for p'' and q'', found in Chapter XXV, we get the remaining portion of  $\sin \beta_0$ , which is due to the motion of the ecliptic; it is

$$\sin \beta_0 = \begin{bmatrix} '' & '' & '' \\ 46.7603T - 0.05665T^2 - 0.000506T^3 \end{bmatrix} \sin l + \begin{bmatrix} 5.2691T + 0.19508T^2 - 0.000240T^3 \end{bmatrix} \cos l$$

It is not worth while to add here the two portions together, as the first has been computed with the values of the masses of the planets adopted at the beginning of this investigation, and which will receive some modifications, in consequence of the comparison of the theory with observation, to be given in the following chapter. But in deriving the motion of the ecliptic, in Chapter XXV, regard has been taken of these modifications.

The following is the expression we obtain for  $\Delta\beta$ :

| Ann-i(a) i a                             | Δβ   |   | Ana_i/a/ 1 i.a   | Δβ  |   |
|--|--|---|--|---|---|
| Arg=i'g'+ig                              | sin.   | cos.  | Arg=i'g'+ig  | sin.  | cos.  |

At intervals of 500 years have been computed the following quantities:

| Date. | $\frac{\zeta \sin i_0 + \gamma \zeta - \delta \varepsilon}{\sin^2 i}$ | $-B \tan \frac{i}{2}$ | I           | $\theta_0 - \alpha - \eta$ |
|-------|---|-----------------------|-------------|----------------------------|
|       | "   | и                     | 0 / //      | 0 / //                     |
| 850   | <b>-5.2875</b>  | <b>—1.</b> 7083       | 1 22 1.106  | 102 42 45.06               |
| 1350  | -2.6210   | —о. 8381              | 1 20 21.264 | 100 49 23.15               |
| 1850  | 0.0000  | 0.0000                | 1 18 42.100 | 98 56 19.79                |
| 2350  | +2.5717   | +o.8060               | I 17 3.627  | 97 3 34.81                 |
| 2850  | +5.0899   | +1.5800               | 1 15 25.862 | 95 11 8.78                 |

Thence the reduction to the ecliptic and mean equinox is

$$\lambda - l = + 27.029 \sin (2l + 342^{\circ} 7' 20'') + 0''.002 \sin (4l + 324^{\circ})$$

$$+ [5026.4708 + 0''.4211 \sin (2l + 104^{\circ} 37'.9)]T$$

$$+ [1.10576 + 0''.00351 \sin (2l + 223^{\circ} 9')]T^{2}$$

$$+ [0.000169 + 0''.000020 \sin (2l + 340^{\circ})]T^{3}$$

$$- 0.0000488T^{4} - 0''.00000023T^{6}$$

We have here, then, h = 50''.264708, and for  $\delta R$  the sum of the inequalities of the reduction

$$\begin{split} \delta \mathbf{R} &= \Gamma - \frac{1}{2} s \frac{ds}{dv} - \tan i \cos (l - \theta_0 + \alpha) \cdot \Delta \beta \\ &+ o''.4211 \mathrm{T} \sin (2l + 104^{\circ} 37.'9) \\ &+ [1''.10576 + o''.00351 \sin (2l + 223^{\circ} 9')] \mathrm{T}^2 \\ &+ [o''.000169 + o''.000020 \sin (2l + 340^{\circ})] \mathrm{T}^3 \end{split}$$

From eight computed special values it is found that

$$\frac{ndz}{d\lambda} = 1.002333 - 0.094641 \cos l - 0.019961 \sin l + 0.002958 \cos 2l + 0.001332 \sin 2l - 0.000060 \sin 3l - 0.000060 \sin 3l$$

Also, in like manner we get, when  $\delta R$  is limited to the three latter lines of the expression above,

$$\frac{ndz}{d\lambda}\delta R = \begin{bmatrix} & & & & & & \\ & & + 0.0019 \\ & + 0.0379 & \sin & nz - 0.0477 & \cos & nz \\ & - 0.2606 & \sin & 2nz + 0.3283 & \cos & 2nz \\ & - 0.0126 & \sin & 3nz + 0.0158 & \cos & 3nz \\ & - 0.0006 & \sin & 4nz + 0.0007 & \cos & 4nz]T \end{bmatrix}$$

$$+ \begin{bmatrix} & & + 1.11086 \\ & + 0.00016 & \sin & nz - 0.10630 & \cos & nz \\ & - 0.00134 & \sin & 2nz - 0.00482 & \cos & 2nz \\ & + 0.00004 & \sin & 3nz - 0.00020 & \cos & 3nz]T^2 \end{bmatrix}$$

$$+ \begin{bmatrix} & & + 0.000169 \\ & - 0.000003 & \sin & nz - 0.000016 & \cos & nz \\ & + 0.000001 & \sin & 2nz + 0.000001 & \cos & 2nz \\ & + 0.0000001 & \sin & 3nz & 0.000000 & \cos & 3nz]T^3 \end{bmatrix}$$

In this, for nz, ought to be substituted  $g + n\delta z$ . But we may take for  $n\delta z$  its eleven largest terms and neglect its square. When this is done, and we also obtain the terms which arise from the first line of the value of  $\delta R$ , we have the following complete expression for  $\Delta(n\delta z)$ :

| Arg=i'g'+ig -                                    | $\varDelta(n\delta z)$   |  |  |  |  |

The terms of this expression not multiplied by T or its powers represent nearly the periodic perturbations of the reduction of the longitude to the ecliptic.

The correction which must be applied to the common logarithm of  $\frac{r}{\tilde{r}}$ , on account of this change in the fundamental argument, is determined in a similar way, and is (in units of the seventh decimal):

| Arg = i'g' + ig | $-rac{d(	ext{com.}\log r)}{dz}	extstyle d(\delta z)$ |  |           |   |  |

The correction to be applied to  $\sin \beta_0$ , on the same account, is

$$-\frac{d(\sin \beta_0)}{dz}\Delta(\delta z) = \begin{bmatrix} 0.0044\text{T} - 0.02504\text{T}^2 + 0.000075\text{T}^3 \end{bmatrix} \sin l + [0.0019\text{T} + 0.00395\text{T}^2 - 0.000179\text{T}^3] \cos l + [-0.0048\text{T} + 0.00002\text{T}^2] \sin 3l + [-0.0005\text{T} - 0.00003\text{T}^2] \cos 3l$$

Application of the Formulæ to Saturn.

Proceeding in exactly the same way as for Jupiter it is found that

In this expression g' ought to be replaced by  $g' + n'\delta z'$ ; it is sufficient to take for  $n'\delta z'$  the three terms having the arguments 2g' - g, 4g' - 2g, and 5g' - 2g. The additional terms. which should be joined to the expression, are

+ 0.0000572 cos ( 
$$g'-g$$
)  
- 0.0000572 cos ( $3g'-g$ )  
- 0.0000117 cos ( $3g'-2g$ ) - 0.0000921 sin ( $3g'-2g$ )  
+ 0.0001482 cos ( $4g'-2g$ ) - 0.0003652 sin ( $4g'-2g$ )  
+ 0.0000117 cos ( $5g'-2g$ ) + 0.0000921 sin ( $5g'-2g$ )  
- 0.0001482 cos ( $6g'-2g$ ) + 0.0003652 sin ( $6g'-2g$ )

In a similar way have been obtained the two expressions

$$\frac{r'}{a'} \sin f' = \frac{0.0000003 - 0.0005529\text{T}}{+ [0.9980325 + 0.0000145\text{T}] \sin g' + [0.000051 - 0.0000386\text{T}] \cos g'} \\ + [0.0279551 - 0.0003436\text{T}] \sin 2g' + [0.0000014 - 0.0005547\text{T}] \cos 2g'} \\ + [0.0011714 - 0.0000241\text{T}] \sin 3g' + [0.0000051 - 0.0000387\text{T}] \cos 3g'} \\ + [0.0000583 - 0.0000016\text{T}] \sin 4g' + [0.000017 - 0.0000026\text{T}] \cos 4g'} \\ + 0.0000032 \qquad \qquad \sin 5g' \qquad - 0.0000001\text{T} \cos 5g'$$

$$\frac{r'}{a'}\cos f' = -0.0840851 + 0.0003454T$$

$$+ [0.0000051 + 0.0000233T] \sin g' + [0.9988249 + 0.0000241T] \cos g'$$

$$+ [-0.0000014 + 0.0005448T] \sin 2g' + [0.0279697 - 0.0003438T] \cos 2g'$$

$$+ [-0.0000051 + 0.0000388T] \sin 3g' + [0.0011718 - 0.0000241T] \cos 3g'$$

$$+ [0.0000011 + 0.0000026T] \sin 4g' + [0.0000583 - 0.000016T] \cos 4g'$$

$$+ 0.0000001T \sin 5g' + 0.000032 \cos 5g'$$

 $\Delta \beta'$  is obtained from its equation, put in the form

$$\varDelta\beta' = \frac{a}{\tilde{r}} \sec. \ \beta_0' \left[ \frac{a_0'^2}{\mathbf{a}'^2} \cos i' \ . \ u' - \mathbf{A} \frac{\bar{r}'}{\bar{a}'} \sin f' - \mathbf{B} \frac{\bar{r}'}{\bar{a}'} \cos f' \right]$$

It is found that

$$A = + 23.8966T - 0.21464T^{2}$$

$$B = + 33.4890T + 0.16184T^{2}$$

Since  $f' = l' - 90^{\circ}$  6' 46".22 we have, as far as these terms are concerned, joining to them the terms of the third order, obtained in Chapter XXV,

$$\cos i' \sin b' = \begin{bmatrix} 33.4419T + 0.16226T^2 - 0.000858T^3 \end{bmatrix} \sin l' + \begin{bmatrix} -23.9625T + 0.21432T^2 + 0.000641T^3 \end{bmatrix} \cos l'$$

The remaining portion of  $\sin \beta_0'$ , due to the motion of the ecliptic, is

$$\sin \beta_0' = \begin{bmatrix} 1/46.7526T - 0.05662T^2 - 0.000506T^3 \end{bmatrix} \sin l' + \begin{bmatrix} 5.2524T + 0.19509T^2 - 0.000240T^3 \end{bmatrix} \cos l'$$

For the same reason, as in the case of Jupiter, we do not add these two portions. The following expression is obtained for  $\Delta\beta'$ :

|   | Δ  | $oldsymbol{eta}'$   | Amm i/a/ Lin                                       | $\Delta eta'$  |  |
|---|--|---|--|--|--|

At intervals of 500 years have been computed the following quantities:

Thence the reduction to the ecliptic and mean equinox is

$$\lambda' - l' = + 97.774 \qquad \sin (2l' + 315 \ 18 \ 22) + 0.023 \quad \sin (4l' + 270 \ 37)$$

$$+ \begin{bmatrix} 5025.8141 & + 1.7921 & \sin (2l' + 54 \ 33.2 & ) + 0.0008 & \sin (4l' + 7 & ) \end{bmatrix} T$$

$$+ \begin{bmatrix} 1.10629 & + 0.01737 & \sin (2l' + 148 \ 11 & ) + 0.00002 & \sin (4l' + 90 & ) \end{bmatrix} T^{2}$$

$$+ \begin{bmatrix} 0.000179 & + 0.000115 & \sin (2l' + 239 \ 38 & ) \end{bmatrix} T^{3}$$

$$+ \begin{bmatrix} - 0.0000488 + 0.0000005 & \sin (2l' + 338 & ) \end{bmatrix} T^{4}$$

$$- 0.00000023 T^{5}$$

We have, then, h = 50''.258141, and for  $\delta R'$  the sum of the inequalities of the reduction

$$\begin{split} \delta\mathbf{R}' &= \Gamma' - \frac{1}{2} s' \frac{ds'}{dv'} - \tan i' \cos (l' - \theta_0' + \alpha') \cdot \Delta \beta' \\ &+ [i''.792i \sin (2l' + 54^{\circ} 33'.2) + o''.ooo8 \sin (4l^{\circ} + 7^{\circ})]\mathbf{T} \\ &+ [i''.10629 + o''.o1737 \sin (2l' + 148^{\circ} 11') + o''.ooo2 \sin (4l' + 90^{\circ})]\mathbf{T}^{9} \\ &+ [o''.ooo179 + o''.ooo115 \sin (2l' + 239^{\circ} 38')]\mathbf{T}^{9} \end{split}$$

By the method of computing special values, when  $\delta R'$  is limited to the three latter lines of the expression above, we get

$$\frac{n'dz'}{d\lambda'}\delta R' = \begin{cases} -0.0123 \\ +0.1737 & \sin n'z' + 0.2462 & \cos n'z' \\ -1.0271 & \sin 2n'z' - 1.4547 & \cos 2n'z' \\ -0.0575 & \sin 3n'z' - 0.0815 & \cos 3n'z' \\ -0.0035 & \sin 4n'z' - 0.0048 & \cos 4n'z']T \end{cases}$$

$$+ \begin{cases} +1.11323 \\ -0.00256 & \sin n'z' - 0.12278 & \cos n'z' \\ +0.01543 & \sin 2n'z' - 0.01008 & \cos 2n'z' \\ +0.00082 & \sin 3n'z' - 0.00052 & \cos 3n'z']T^2 \end{cases}$$

$$+ \begin{cases} 0.000179 \\ -0.000006 & \sin n'z' - 0.000038 & \cos n'z' \\ +0.000056 & \sin n'z' - 0.000038 & \cos n'z' \\ -0.0000006 & \sin n'z' - 0.000005 & \cos n'z' \end{bmatrix} T^2 \end{cases}$$

In this expression for n'z' ought to be substituted  $g' + n'\delta z'$ . For  $n'\delta z'$  it will be sufficient to take its more important terms, and its square can be neglected. When this is done, and we also obtain the terms which arise from the first line of the value of  $\delta R'$ , we have the following complete expression for  $\Delta(n'\delta z')$ :

|              | ${\it \Delta}(n'\delta z')$  |   |  |  |  |  |

The correction to the latitude on the same account can be divided into two portions; the first, which is periodic and dependent on the position of Jupiter, can be added to  $\Delta\beta'$ ; the second, which is a function of l', can be applied to  $\sin \beta_0'$ . The first portion is

The portion to be added to the expression for  $\sin \beta_0$  is

### CHAPTER XXVIII.

PRELIMINARY COMPARISON OF THE PRECEDING THEORY WITH OBSERVATION AND DERIVATION OF APPROXIMATE CORRECTIONS FOR THE ELEMENTS EMPLOYED IN THE CALCULATION OF THE PERTURBATIONS.

If the elements of the orbits of Jupiter and Saturn which have been employed in the preceding investigation were sufficiently approximate the expressions arrived at would need no further modification, except for possible changes in the values of the planetary masses. But as this is almost certainly not the case, we proceed to obtain approximate corrections for the provisionally adopted elements by a comparison of the preceding theory with observation. As the adopted planes of the orbits represent quite closely the observed latitudes of the planets, we need seek only the corrections of the four elements which give the position in orbit. Consequently comparison has been made only with normals in heliocentric longitude formed about the time of opposition. The thorough investigation of the values of the attracting masses must be deferred until the whole series of the observations, properly reduced, is taken in hand. The number of normals used here is very small on account of the great labor of making comparisons without the assistance of tables. There are only as many as are absolutely necessary for our purpose.

In forming the normals, Greenwich observations, taken precisely as they stand in the published volumes, without the application of any corrections, have been exclusively employed. Before 1830 the data have been derived from the Reduction of the Greenwich Observations of the Planets from 1750 to 1830. After 1830 the tabular longitude is from the English Nautical Almanac. Equal weights have been assigned to all the observations, and afterwards, in the discussion, all the normals have received equal weight.

We take up Saturn first, as the discussion of the observations of this planet will give us some information as to the mass of Uranus, which will be of service afterwards in treating Jupiter.

The normals constructed are as follows:

| Greenwich M. T. | No. of<br>observa-<br>tions. | Tabular longitude. | Correction.    | Observed heliocentric longitude. |
|-----------------|------------------------------|--------------------|----------------|----------------------------------|
|                 |                              | 0 / //             | "              | c / //                           |

| 24. 58864  | 174 14 35.72 | 225 12 51.46 | 325 31 48 | 345. 52         |
| +32.87338  | 65 40 37.49  | 326 27 47.38 | 1 1 47    | 3. 62           |

By substituting these values in the several portions of the formula obtained for  $n'\delta z'$  in the preceding chapters, we get the following quantities:

|                        | Perturbations of $n'z'$ by— |                      |                |              |               |  |  |  |  |  |  |

The  $n'\delta z'$  must be understood as the  $n'\delta z'$  before the modification of the preceding chapter is applied. In order to have the heliocentric longitude referred to the actual equinox of date it is necessary to add to f': first,  $\pi'$ , precession, nutation, and the secular part of the reduction to the ecliptic, and, second, the periodic part of the last. Thus we have the following quantities:

| $\pi'$ + precession + nutation. | Periodic reduction. | Calculated longitude. |
|---------------------------------|---------------------|-----------------------|
| 0 / //                          | , ,,                | 0 / //                |

The residuals of Supposition I are not altogether satisfactory, and, on comparing them with the portions of the perturbations which are proportional to the mass of Uranus, it is suggested that a better agreement would be obtained by diminishing this mass. Hence, I concluded to put the value at  $\frac{I}{22640}$ , which is about the average of all the results which have been obtained from the observations of the satellites at the Washington Observatory. This has given rise to the numbers of the column headed Supposition II. It will be seen that the residuals of (II) are fairly satisfactory, and it does not seem worth while, in this preliminary investigation, to inquire whether we should do better with another value of the mass of Uranus.

The pertubations being now corrected for the changes in the elements shown by (II), and for the similar ones to be given hereafter for Jupiter, the resulting numbers appear under Supposition III, to which we hold as being the best which can be done at present. The residuals of (III) are to some extent better than those of (II).

We now pass to Jupiter. The normals are formed as follows:

| Greenwich M. T. | No. of observa- | Tabular longitude. | Correction. | Heliocentric longitude from observation. |
|-----------------|-----------------|--------------------|-------------|--|
|                 |                 | 0 / 1/             | "           | 0 / //                                   |

Supposition I corresponds to Bessel's value  $\frac{1}{35^{\circ}1.6}$  of the mass of Saturn, while (II) results from using the value  $\frac{1}{3482.2}$ , recently derived by Prof. A. Hall from observations of Japetus. The residuals of (II) are generally larger than those of (I), and, in consequence, I shall hold to Bessel's value, although it is possible that when the observations are more properly reduced a better showing may result for the larger mass. In fine, Supposition III results from (I) by applying to the perturbations the corrections due to the adopted changes in the elements.\*

<sup>\*</sup> It will be noticed that some of the numbers given in this chapter differ slightly from those stated in the Astr. Nachr., Nos. 2705-2706. This is because at the time of the publication of the latter the term — B  $\tan \frac{i}{2}$ , in the reduction of orbit to ecliptic longitude (in formula on page 523), had not been noticed. Hansen determines his  $n\delta z$  in such a way that it contains no term rigorously proportional to the time. This differs from the course followed by those who employ other methods of perturbation. They make the orbit longitude, as measured along a fixed ecliptic until the node is reached and then on the plane of the orbit, to have no perturbations proportional to t. But Hansen regards the term  $2 \sin^2 \frac{i}{2} \frac{d\theta}{dt}$  as belonging to the reduction to the ecliptic.

### CHAPTER XXIX.

RECTIFICATION OF THE FORMULÆ FOR THE PERTURBATIONS ON ACCOUNT OF THE CORRECTIONS OF THE ELEMENTS JUST DETERMINED.

Hansen has treated this matter,\* but the expressions he derives are suitable to the employment of the eccentric anomaly as independent variable. As the modifications, to be made in order to render them applicable when the mean anomaly or the time is employed as independent variable, are not readily perceived, we will, as briefly as possible, develop them here.

We shall suppose that the elements which define the positions of the planes of the two orbits are known at the outset with sufficient exactitude to insure the desired degree of accuracy in the expressions of the perturbations so far as it depends on them. We can also suppose that the terms of two dimensions, with respect to disturbing forces, require no sensible correction on account of changes made in the elements; and we may assume that the same is true for u and u'. Hence, we shall limit our attention to determining the effects produced in the first-order terms of  $n\delta z$ ,  $\nu$ ,  $n'\delta z'$ , and  $\nu'$ .

Consequently, we can assume

$$\begin{split} \frac{1}{n} \frac{dW_0}{dt} &= T = Aa_0 \frac{d\Omega}{dg} + Ba_0 r \frac{d\Omega}{dr} \\ n\delta z &= \int \left[ \int \overline{Tndt} \right] ndt \\ \nu &= \text{const.} - \frac{1}{2} \int \left( \frac{\overline{d} \cdot \left[ \int \overline{Tndt} \right]}{d\gamma} \right) ndt \end{split}$$

The augmentation of the elements being denoted by  $\Delta a$ ,  $\Delta a'$ ,  $\Delta e$ ,  $\Delta e'$ ,  $\Delta \pi$ , and  $\Delta \pi'$ , we have

$$\begin{split} \varDelta \mathbf{T} &= \frac{d\mathbf{T}}{da} \varDelta a + \frac{d\mathbf{T}}{da'} \varDelta a' + \frac{d\mathbf{T}}{de} \varDelta e + \frac{d\mathbf{T}}{de'} \varDelta e' + \frac{d\mathbf{T}}{d\pi} \varDelta \pi + \frac{d\mathbf{T}}{d\pi'} \varDelta \pi' \\ \mathbf{T} &= \frac{a}{\cos \varphi} \left[ \frac{\rho}{r} \cos (f - \omega) - \mathbf{I} + \frac{2\rho}{a \cos^2 \varphi} [\cos (f - \omega) - \mathbf{I}] \right] \frac{d\Omega}{dv} + \frac{2a}{\cos \varphi} \frac{\rho}{r} \sin (f - \omega) r \frac{d\Omega}{dr} \end{split}$$

T may be regarded, then, as a function of a,  $\varphi$ ,  $\rho$ , r, f,  $\omega$ , f', r',  $\pi$ , and  $\pi'$ ; or, what is the same thing, as a function of a,  $\varphi$ ,  $\rho$ , r, r',  $f + \pi$ ,  $\omega + \pi$ , and  $f' + \pi'$ . And it is evident that, instead of taking the partial derivatives of T with respect to  $f + \pi$ ,  $\omega + \pi$ ,

and  $f' + \pi'$ , we may take them with respect to g,  $\gamma$ , and g', provided that  $\Delta g$ ,  $\Delta \gamma$ , and  $\Delta g'$  are determined by the equations

$$\Delta g = \frac{\frac{df}{de}}{\frac{de}{dg}} \Delta e + \frac{1}{\frac{df}{dg}} \Delta \pi$$

$$\Delta \gamma = \frac{\frac{d\omega}{de}}{\frac{d\omega}{d\gamma}} \Delta e + \frac{1}{\frac{d\omega}{d\gamma}} \Delta \pi$$

$$\Delta g' = \frac{\frac{df'}{de'}}{\frac{de'}{dg'}} \Delta e' + \frac{1}{\frac{df'}{dg'}} \Delta \pi'$$

and that we conceive r,  $\rho$ , and r' to be augmented by  $r\Delta \nu$ ,  $\rho\Delta\beta$ , and  $r'\Delta\nu'$ , such that

$$\Delta \nu = \frac{\Delta a}{a} - \frac{\cos \frac{\varepsilon}{\epsilon} + e}{\cos^2 \varphi} \Delta e - \frac{e \sin \varepsilon}{\cos \varphi} \Delta \pi$$

$$\Delta \beta = \frac{\Delta a}{a} - \frac{\cos \frac{\eta}{\epsilon} + e}{\cos^2 \varphi} \Delta e - \frac{e \sin \frac{\eta}{\epsilon}}{\cos \varphi} \Delta \pi$$

$$\Delta \nu' = \frac{\Delta a'}{a'} - \frac{\cos \varepsilon' + e'}{\cos^2 \varphi'} \Delta e' - \frac{e' \sin \varepsilon'}{\cos \varphi'} \Delta \pi'$$

Then, we have

$$\Delta \mathbf{T} = \frac{d\mathbf{T}}{dq} \Delta g + \frac{d\mathbf{T}}{dq'} \Delta g' + r \frac{d\mathbf{T}}{dr} \Delta \nu + r' \frac{d\mathbf{T}}{dr'} \Delta \nu' + a \frac{d\mathbf{T}}{da} \frac{\Delta a}{a} + \frac{d\mathbf{T}}{d\varphi} \Delta \varphi + \frac{d\mathbf{T}}{d\psi} \Delta \gamma + \rho \frac{d\mathbf{T}}{d\rho} \Delta \beta$$

The coefficients of the first four terms have already been used for the computation of the second-order terms. Also

$$\begin{split} a\frac{d\mathbf{T}}{da} &= \mathbf{T} - \frac{4\rho}{\cos^3\varphi} [\cos{(f-\omega)} - \mathbf{1}] \frac{d\Omega}{dv} \\ \mathbf{T} &= \frac{a}{\cos\varphi} \frac{d\Omega}{dv} \end{split}$$

In computing the second-order terms we have derived the value of

$$\mathbf{X} = -\frac{2a}{\cos\varphi} \frac{\rho}{r} \cos(f - \omega) \cdot \frac{d\Omega}{dv} - \frac{2a}{\cos\omega} \frac{\rho}{r} \sin(f - \omega) \cdot r \frac{d\Omega}{dr}$$

whence

$$a\frac{d\mathbf{T}}{da} = \mathbf{T} - 2(\mathbf{T} + \mathbf{X} + \mathbf{T}) = \mathbf{T} - \mathbf{C}$$

$$\frac{d\mathbf{T}}{d\varphi} = \frac{e}{\cos\varphi} \left[ \mathbf{T} + \mathbf{z} (\mathbf{T} + \mathbf{X} + \mathbf{\bar{T}}) \right] = \frac{e}{\cos\varphi} \left[ \mathbf{T} + \mathbf{C} \right]$$

Consequently, as

$$\log h = \text{const.} - \frac{1}{2} \log a - \log \cos \varphi$$

and thence

$$\frac{\Delta h}{h} = -\frac{1}{2} \frac{\Delta a}{a} + \frac{e}{\cos \omega} \Delta \varphi$$

we shall have

$$\Delta \mathbf{T} = \mathbf{A} \Delta g + \mathbf{F} \Delta g' + \mathbf{B} \Delta \nu + \mathbf{G} \Delta \nu' + \mathbf{C} \left( \frac{\Delta h}{h} - \frac{\mathbf{I}}{2} \frac{\Delta a}{a} \right) + \mathbf{T} \left( \frac{\Delta a}{a} + \frac{e \Delta e}{\cos^2 \varphi} \right) + \frac{d\mathbf{T}}{d\gamma} \Delta \gamma + (\mathbf{T} + \mathbf{T}) \Delta \beta$$

The computation of the first five terms of this formula is then quite similar to that of the second-order terms, and we may put

$$L = A\Delta g + F\Delta g' + B\Delta v + G\Delta v' + C\left(\frac{\Delta h}{h} - \frac{1}{2}\frac{\Delta a}{a}\right)$$

Integrating, we derive

$$\begin{split} \varDelta W_0 &= \int \operatorname{L} \! n dt + \left(\frac{\varDelta a}{a} + \frac{e \varDelta e}{\cos^2 \varphi}\right) W_0 + \varDelta \beta (W_0 + \int \operatorname{T} \! n dt) \right. \\ &= \int \operatorname{L} \! n dt + \left(\frac{\varDelta a}{a} + \frac{e \varDelta e}{\cos^2 \varphi}\right) W_0 + \varDelta \beta (W_0 + \overline{W_0} + 2\nu) + \frac{dW_0}{d\gamma} \varDelta \gamma \\ \\ \varDelta (n \delta z) &= \int \left[ \left(\overline{\int \operatorname{L} \! n dt}\right) + \left(\frac{\overline{dW_0}}{d\gamma}\right) \varDelta g + 2(W_0 + \nu) \varDelta \nu + \left(\frac{\varDelta a}{a} + \frac{e}{\cos^2 \varphi} \varDelta e\right) \overline{W_0} \right] n dt \\ \\ &= \int \left[ \left(\overline{\int \operatorname{L} \! n dt}\right) - 2 \frac{d\nu}{n dt} \varDelta g + 2 \left(\frac{d \cdot \delta z}{dt} + \nu\right) \varDelta \nu \right] n dt + \left(\frac{\varDelta a}{a} + \frac{e}{\cos^2 \varphi} \varDelta e\right) n \delta z \\ \\ \varDelta \nu &= -\frac{1}{2} \int \left[ \left(\overline{\frac{d \cdot \int \operatorname{L} \! n dt}{d\gamma}}\right) + \left(\overline{\frac{d^2 W_0}{d\gamma^2}}\right) \varDelta g + \left(\overline{\frac{dW_0}{d\gamma}}\right) \frac{d \cdot \varDelta g}{dg} + \left(\frac{\varDelta a}{a} + \frac{e}{\cos^2 \varphi} \varDelta e\right) \left(\overline{\frac{dW_0}{d\gamma}}\right) + \left(\overline{\frac{dW_0}{d\gamma}}\right) \varDelta \nu + 2(W_0 + \nu) \frac{d \cdot \varDelta \nu}{dg} \right] n dt \end{split}$$

But from formulæ to be given shortly it will be seen that

$$\frac{d \cdot \Delta g}{dq} = 2\frac{\Delta a}{a} - 2\Delta \nu - \frac{e}{\cos^2 \varphi} \Delta e$$

Hence

The expressions for  $\Delta g$  and  $\Delta v$  are

We have yet to ascertain the corrections due to the change of the integrating factors. T being a function composed of such terms as

$$T = A \sin (\varkappa \gamma + i'g' + ig) + B \cos (\varkappa \gamma + i'g' + ig)$$

we have

$$W_0 = -\frac{A}{i'\frac{n'}{n} + i}\cos(n\gamma + i'g' + ig) + \frac{B}{i'\frac{n'}{n} + i}\sin(n\gamma + i'g' + ig)$$

Whence

$$\Delta W_0 = \left[ \frac{i'A}{\left(i'\frac{n'}{n} + i\right)^2} \cos\left(\varkappa \gamma + i'g' + ig\right) - \frac{i'B}{\left(i'\frac{n'}{n} + i\right)^2} \sin\left(\varkappa \gamma + i'g' + ig\right) \right] \Delta \frac{n'}{n}$$

But

$$\int W_0 n dt = \frac{A}{\left(i'\frac{n'}{n} + i\right)^2} \sin\left(\mu\gamma + i'g' + ig\right) - \frac{B}{\left(i'\frac{n'}{n} + i\right)^2} \cos\left(\mu\gamma + i'g' + ig\right)$$

whence

$$\Delta \mathbf{W}_0 = -\frac{d \cdot \int \mathbf{W}_0 n dt}{dg'} \Delta \frac{n'}{n}$$

and

$$\Delta \overline{\mathbf{W}_0} = -\frac{d \cdot (\overline{\int \mathbf{W}_0 n dt})}{dg'} \Delta \frac{n'}{n} = -\left(\overline{\int \frac{d \mathbf{W}_0}{dg'} n dt}\right) \Delta \frac{n'}{n}$$

In like manner

$$-\frac{1}{2}\left(\overline{\Delta \frac{dW_0}{d\gamma}}\right) = \frac{1}{2}\left(\overline{\int \frac{d^2W_0}{d\gamma dg'}ndt}\right) \Delta \frac{n'}{n}$$

Thus, we have, for getting the corrections of the perturbations due to a change in the integrating factors, the very simple formulæ

$$\Delta(n\delta z) = -2 \left[ \int \frac{d \cdot (n\delta z)}{dg'} n dt \right] \Delta \frac{n'}{n}$$

$$\Delta v = -2 \left[ \int \frac{dv}{dg'} n dt \right] \Delta \frac{n'}{n}$$

On account of the smallness of the eccentricities of the major planets it often happens that the corrections  $\Delta\pi$  and  $\Delta\pi'$  are quite large, while the effects of these corrections on the positions of the planets, being more properly represented by the products  $e\Delta\pi$  and  $e'\Delta\pi'$ , are quite small. In these cases it may be reasonably feared, since  $\Delta g$  and  $\Delta y$  contain the term

$$\frac{1+\frac{3}{2}e^2}{\cos\varphi}\Delta\pi$$

and  $\Delta g'$  the term

$$\frac{1 + \frac{3}{2}e'}{\cos \varphi'} \Delta \pi'$$

that it will not be sufficiently approximate to consider the corrections of the perturbations as equivalent to linear functions of  $\Delta g$ ,  $\Delta v$ ,  $\Delta g'$ ,  $\Delta v'$ , etc., the terms involving the squares of  $\Delta g$  and  $\Delta g'$  and their products with  $\Delta v$ ,  $\Delta v'$ , etc., becoming sensible on account of the largeness of  $\Delta \pi$  and  $\Delta \pi'$ .

A little consideration, however, shows that this difficulty may be readily surmounted. Let us suppose that putting, for the sake of brevity,

$$\mathbf{E} = \frac{\mathbf{I} + \frac{3}{2}e^2}{\cos \varphi} \qquad \qquad \mathbf{E}' = \frac{\mathbf{I} + \frac{3}{2}e'}{\cos \varphi'}$$

we substitute for  $\Delta g$ ,  $\Delta \gamma$ , and  $\Delta g'$  the expressions

$$\Delta g = \mathbf{E} \Delta \pi + \Delta(g)$$
$$\Delta \gamma = \mathbf{E} \Delta \pi + \Delta(\gamma)$$
$$\Delta g' = \mathbf{E}' \Delta \pi' + \Delta(g')$$

so that

$$\varDelta(g) = \frac{2\varDelta e}{\cos^2\varphi} \bigg[ \bigg( J_{\frac{s}{2}}^{(0)} - J_{\frac{s}{2}}^{(2)} \bigg) \sin g + \frac{1}{4} \bigg( J_{\epsilon}^{(1)} - J_{\epsilon}^{(3)} \bigg) \sin 2g + \frac{1}{9} \bigg( J_{\frac{3}{2}\epsilon}^{(2)} - J_{\frac{3}{2}\epsilon}^{(4)} \bigg) \sin 3g + \cdot \cdot \cdot \bigg] \\ - \frac{2e\varDelta\pi}{\cos\varphi} \bigg[ \bigg( J_{\frac{s}{2}}^{(0)} + J_{\frac{s}{2}}^{(2)} \bigg) \cos g + \frac{1}{4} \bigg( J_{\epsilon}^{(1)} + J_{\epsilon}^{(3)} \bigg) \cos 2g + \frac{1}{9} \bigg( J_{\frac{3}{2}\epsilon}^{(2)} + J_{\frac{3}{2}\epsilon}^{(4)} \bigg) \cos 3g + \cdot \cdot \cdot \bigg]$$

with a similar expression for  $\Delta(g')$ . Now, when g,  $\gamma$ , and g' are augmented by their increments  $\Delta g$ ,  $\Delta \gamma$ , and  $\Delta g'$ , the variation of the arguments due to the terms  $\mathbf{E} \Delta \pi$  and  $\mathbf{E}' \Delta \pi'$  may be retained within the functional signs sin and cos, and the corrections of the perturbations exhibited as a linear function of  $\Delta(g)$ ,  $\Delta(g')$ , etc. Thus the general argument  $\kappa \gamma + i'g' + ig$  becomes

$$ny + i'g' + ig + (n + i)E\Delta\pi + i'E'\Delta\pi'$$

The presence of the two terms ending this expression evidently has no influence on the coefficient when integrations are performed, or when we go through the operation of putting y = g. Hence the following precept:

In the preceding formulæ, for obtaining the corrections of the perturbations arising from changes in the elements, we may everywhere substitute  $\Delta(g)$  and  $\Delta(g')$  for  $\Delta g$  and  $\Delta g'$ , provided that at the end, when the expressions for the perturbations have been reduced to series of terms of the form

$$\mathbb{K} n^k t^k \sin_{\cos} \left( i'g' + ig + \varkappa \right)$$

we replace x by

$$\mathbf{x} + i\mathbf{E}\Delta\pi + i'\mathbf{E}'\Delta\pi'$$

or, which applies to any form the perturbations may be in, we everywhere replace g by  $g + E \Delta \pi$ , and g' by  $g' + E' \Delta \pi'$ .

In applying these formulæ to Jupiter and Saturn it was assumed that

$$\Delta e = + 2.566$$
  $\Delta e' = + 0.527$   
 $e\Delta \pi = - 4.550$   $e'\Delta \pi' = - 0.093$   
 $\Delta n = + 0.06958$   $\Delta n' = + 0.12853$ 

From these numbers we derive

$$\log \frac{\Delta a}{a} = 3.6280n \qquad \log \frac{\Delta a'}{a'} = 4.2895n$$

$$\log 2\Delta \frac{n'}{n} = 4.2648 \qquad \log 2\Delta \frac{n}{n'} = 5.0548n$$

$$\log \left(\frac{\Delta a}{a} + \frac{e\Delta e}{\cos^2 \varphi}\right) = 3.2479 \qquad \log \left(\frac{\Delta a'}{a'} + \frac{e'\Delta e'}{\cos^2 \varphi'}\right) = 4.2563n$$

$$E\Delta\pi = -1'34''.75 \qquad E'\Delta\pi' = -1''.67$$

$$\Delta(g) = 2 \left[5.0955\right] \sin g + 2 \left[5.3440\right] \cos g$$

$$+ 2 \left[3.1766\right] \sin 2g + 2 \left[3.4251\right] \cos 2g$$

In addition to the corrections here stated it must be understood that in all the arguments g is to be replaced by  $g + E \Delta \pi$ , and g' by  $g' + E' \Delta \pi'$ .

#### CHAPTER XXX.

ADDITION OF THE SEVERAL PORTIONS OF THE EXPRESSIONS FOR THE CO-ORDINATES OF JUPITER
AND SATURN AND REDUCTION OF THEM TO THEIR FINAL FORM.

In this final chapter we snall be engaged in putting the expressions we have arrived at in a final form. In the first place, it is determined to change the values of the masses of four of the major planets so that they stand as follows:

Mercury, 
$$\frac{1}{750000}$$
 Earth,  $\frac{1}{327000}$  Venus,  $\frac{1}{408134}$  Uranus,  $\frac{1}{22640}$ 

The remaining four still retaining the values of their masses, which were stated in Chapter I. Consequently to the terms of the perturbations of Jupiter, which have its own mean anomaly as argument, ought to be added the following corrections:

$$\Delta(n\delta z) = + 0.0001609nt \sin(-g) + 0.00015450nt \cos(-g) + 0.0000019nt \sin(-2g) + 0.0000186nt \cos(-2g) + 0.000000nt \sin(-3g) + 0.000004nt \cos(-3g)$$

$$\Delta v = + 0.0020 + 0.000019nt + 0.00007 \cos(-g) + 0.0000804nt \cos(-g) + 0.00007725nt \sin(-g) + 0.0000019nt \cos(-2g) + 0.0000186nt \sin(-2g) + 0.000001nt \cos(-3g) + 0.000007nt \sin(-3g)$$

In addition the small terms dependent on the elongations of Jupiter, severally from Venus and the Earth, ought to be modified to suit the new values of the masses of the latter planets; also the remaining periodic terms due to the action of Uranus ought to be multiplied by the factor  $\frac{21000}{23640}$ .

For the same reason the terms of the perturbations of Saturn, having its own anomaly as argument, ought to receive the additions

$$\Delta(n'\delta z') = -0.006157n't \sin g' + 0.011276n't \cos g' + 0.0002 \sin 2g' + 0.0001 \cos 2g' - 0.000086n't \sin 2g' + 0.000158n't \cos 2g' - 0.00002n't \sin 3g' + 0.00004n't \cos 3g'$$

$$\Delta v' = +0.0192 + 0.00086n't - 0.0058 \cos g' + 0.005638n't \sin g' + 0.000378n't \cos g' + 0.005638n't \sin g' - 0.0002 \cos 2g' + 0.000158n't \sin 2g' + 0.000086n't \cos 2g' + 0.000158n't \sin 2g' + 0.000086n't \cos 3g' + 0.00007n't \sin 3g'$$

$$\Delta\left(\frac{u'}{\cos i'}\right) = +0.0008 + 0.00026n't - 0.000282n't \sin 2g' - 0.000087n't \cos 2g' - 0.000067n't \sin 2g' - 0.000087n't \cos 2g' - 0.000067n't \sin 2g' - 0.000087n't \cos 2g' - 0.000003n't \sin 2g' - 0.000004n't \cos 3g' - 0.000004n't - 0.00004n't - 0.00004n't - 0.00004n't - 0.00004n't - 0.00004n't - 0.00004n't - 0.00004n't - 0.00004n't - 0.000004n't - 0.00004n't - 0.00004n't - 0.00004n't - 0.00004n't - 0.00$$

In addition the small terms dependent on the elongations of Saturn, severally from Venus and the Earth, ought to be modified to suit the new values of the masses of the latter planets; also the remaining periodic terms due to the action of Uranus ought to be multiplied by the factor  $\frac{21000}{22640}$ .

Hansen's co-ordinate  $\nu$  is not that which it is convenient to tabulate. We adopt  $\log (1 + \nu)$  in its place. Consequently, neglecting all higher powers of  $\nu$  than the second, we add to  $\nu$  the quantity  $-\frac{1}{2}\nu^2$ . The expressions for this, severally in the cases of Jupiter and Saturn, follow:

| Arg=i'g'+ig'                        | $-rac{1}{2} u^2$   |  |  |  |  |  |  |

If we apply to the elements of Jupiter and Saturn, given in Chapter I, the corrections of Supposition III in Chapter XXVIII, we obtain the following system of values:

Epoch 1850, Jan. o.o, Greenwich M. T.

| 0 / //                            | 0 / "                    |
|-----------------------------------|--------------------------|
| L = 159 56 24.98                  | L' = 144938.09           |
| = 11 54 31.67                     | $\pi' = 90 641.37$       |
| $\theta = 98 56 19.79$            | $\theta' = 112 20 49.05$ |
| <i>i</i> = 1 18 42.10             | i' = 22940.19            |
| e = 0.04825511                    | e' = 0.05606025          |
| $n = 109256^{\prime\prime}.62552$ | n' = 43996''.21506       |

In order to tabulate the radius vector of a planet it is necessary to have a clear understanding of the linear unit one wishes to employ. Let us suppose that it is desired that the semi-axis major of the Earth's orbit connected with its sidereal mean motion by the well-known equation should be represented by unity. Then  $m_0$  denoting the Earth's mass and  $n_0$  its mean motion the semi-axis major of Jupiter is given by the equation

$$a = \left[\frac{1 + m}{1 + m_0} \frac{n_0^2}{n^2}\right]^{\frac{1}{3}}$$

and that of Saturn by an equation entirely similar. For  $m_0$  we take the value given at the beginning of this chapter, and we put

$$n_0 = 1295977''.41516$$

It is here understood that  $n_0$  is the constant of the Earth's orbit, which is exactly analogous to the constants n and n', severally belonging to the orbits of Jupiter and Saturn. This gives

$$\log a = 0.7162374088$$
  $\log a' = 0.9794956385$ 

In the expressions for the co-ordinates which follow, the inequalities of the fundamental argument and of the latitude are given the form

$$k_0 \sin (\chi + K_0) + k_1 T \sin (\chi + K_1) + k_2 T^2 \sin (\chi + K_2) + k_3 T^3 \sin (\chi + K_3)$$

and that of common logarithm  $\binom{r}{\bar{r}} = r + \nu$  the form

$$k_0 \cos(\chi + K_0) + k_1 T \cos(\chi + K_1) + k_2 T^2 \cos(\chi + K_2) + k_2 T^3 \cos(\chi + K_3)$$

The unit of T is a century of Julian years, and it is counted from 1850.0. K is so taken that k may be positive, except in the absolute terms, where K is supposed to

vanish and k receives its proper sign. The k belonging to the common  $\log (1 + \nu)$  are uniformily expressed in units of the seventh decimal.

The values of the constituents of the arguments occurring in the formulae are

$$g = 148$$
 1 53.31 + 109256.62552 $t$   
 $g' = 284$  42 56.72 + 43996.21506 $t$   
 $g'' = 220$  10 10.35 + 15425.752 $t$   
 $g''' = 291$  48 8.61 + 7864.935 $t$   
 $9 - 24 = 84$  1 + 1997384.73 $t$   
 $5 - 24 = 299$  52 + 1186720.79 $t$   
 $9 - 5 = 229$  8 + 2062645.15 $t$   
 $5 - 5 = 84$  59 + 1251981.21 $t$ 

Inequalities of the fundamental argument of Jupiter.

To form the value of  $n\delta z$  it is necessary to add together the following expressions:

- I. The first-order terms due to the action of Saturn (pages 103-105).
- II. The first-order terms due to the action of Uranus; as given at page 160 they must be multiplied by the factor  $\frac{21000}{22640}$ .
- III. The first-order terms due to the action of Neptune (page 191).
- IV. The small terms arising from the action of the four interior planets, given at pages 193-196. Those coming from Venus and Earth must be modified to correspond to the masses adopted at the beginning of this chapter.
- V. The second-order terms arising from the mutual action of Jupiter and Saturn (pages 290-292).
- VI. The third-order terms arising from the mutual action of Jupiter and Saturn (pages 404, 405)
- VII. The second-order terms arising from the joint action of Saturn and Uranus; as given at page 479 they must be multiplied by the factor \(\frac{21000}{22640}\).
- VIII. The terms of  $\Delta(n\delta z)$ , given at pages 528, 529.
  - IX. The terms of  $\Delta(n\delta z)$ , given at pages 551, 552.

In passing from terms multiplied by nt to those multiplied by T the logarithm of the factor to be employed is 1.7240226, and in deriving the K we remember that  $E\Delta\pi = -98''.082$  and  $E'\Delta\pi' = -4''.883$ .

Inequalities of the logarithm of the radius-vector of Jupiter.

To form the expression for the common logarithm  $\left(\frac{r}{\bar{r}}=1+\nu\right)$  it is necessary to add the nine portions correspondent to those of  $n\delta z$ , and, in addition, the terms of  $-\frac{1}{2}\nu^2$ , given at pages 555, 556. The logarithm of the factor for passing from seconds of arc in  $\nu$  to units of the seventh decimal in the final form of the co-ordinate is 1.3233592.

## Periodic inequalities of the latitude of Jupiter.

We have only to change the expression given (pages 526, 527) to the form here adopted and to take account of the corrections to the angles K arising from  $E\Delta\pi$  and  $E'\Delta\pi'$ .

|                 |         |          |         |                |              |                  |                | <u> </u>     |                |

We derive f from  $nz = g + n\delta z$  by the formula

$$f = nz + 19900.870 \sin nz + 599.861 \sin 2nz + 25.072 \sin 3nz + 1.198 \sin 4nz + 0.062 \sin 5nz + 0.003 \sin 6nz$$

Then

com. 
$$\log r = 0.71522495 - \text{com.} \log (1 + e \cos f)$$

In addition  $l = f + \pi$ , and we derive R from

$$R = + 27''.029 \sin(2l + 342^{\circ} 7' 20'') + 0''.002 \sin(4l + 324^{\circ})$$

The heliocentric longitude of Jupiter, referred to the mean equinox of date, is

$$\lambda = f + R + \pi + 50''.264708t$$

In order to get the equation which determines  $\sin \beta_0$ , we note that the correction of  $\frac{u}{\cos i}$  (page 554), on account of changes in the values of the disturbing masses, requires that the A and B of page 525 should receive severally the corrections -0''.0075T and +0''.0037T, so that the equation for  $\cos i \sin b$  now becomes

$$\cos i \sin b = \begin{bmatrix} -13.0524\text{T} - 0.06615\text{T}^2 + 0.000324\text{T}^3 \end{bmatrix} \sin l + \begin{bmatrix} 9.4311\text{T} - 0.08661\text{T}^2 - 0.000240\text{T}^3 \end{bmatrix} \cos l$$

If we add this to the expression for the portion of  $\sin \beta_0$ , which arises from the motion of the ecliptic (page 526), and also take account of the correction  $-\frac{d(\sin \beta_0)}{dz} \Delta(\delta z)$ , given at page 530, we obtain

$$\sin \beta_0 = \left[ \sin i_0 \cos \theta_0 + 33.7123 \text{T} - 0.14784 \text{T}^2 - 0.000107 \text{T}^3 \right] \sin l$$

$$+ \left[ -\sin i_0 \sin \theta_0 + 14.7021 \text{T} + 0.11242 \text{T}^2 - 0.000659 \text{T}^3 \right] \cos l$$

$$+ \left[ -0.0048 \text{T} + 0.00002 \text{T}^2 \right] \sin 3l$$

$$+ \left[ -0.0005 \text{T} - 0.00003 \text{T}^2 \right] \cos 3l$$

Inequalities of the fundamental argument of Saturn.

To form the value of  $n'\delta z'$  it is necessary to add together the following expressions:

- I. The first-order terms due to the action of Jupiter (pages 106-108).
- II. The first-order terms due to the action of Uranus; as given at pages 138, 139, they must be multiplied by the factor  $\frac{21000}{22640}$ .
- III. The first-order terms due to the action of Neptune (page 179).
- IV. The small terms arising from the action of the four interior planets, given at pages 196-198. Those coming from Venus and the earth must be modified to correspond to the masses adopted at the beginning of this chapter.
- V. The second-order terms arising from the mutual action of Jupiter and Saturn (pages 335-337).

- VI. The third-order terms arising from the mutual action of Jupiter and Saturn (pages 450-452).
- VII. The second-order terms due to the action of Uranus, and given at pages 474, 475; they must be multiplied by the factor  $\frac{21000}{22640}$ .
- VIII. The second-order terms due to the combined action of Jupiter and Uranus.

  As given at pages 485, 486 they need to be multiplied by 21000/22640.
  - IX. The terms of  $\Delta(n'\delta z')$  given at pages 534, 535.
  - X. The terms of  $\Delta(n'\delta z')$  given at page 553.

In adding these several portions we pass from terms factored by n't to those factored by T by multiplying by the factor whose logarithm is 1.3289902; and, in deriving the K, we take account of the corrections dependent on the quantities  $E\Delta\pi$  and  $E'\Delta\pi'$ .

Inequalities of the logarithm of the radius-vector of Saturn.

To form the expression for  $\log \frac{r'}{\bar{r}'}$  we combine together the ten portions of  $\nu$  corresponding to the ten portions of  $n'\delta z'$  and besides apply to the sum the value of  $-\frac{1}{2}\nu'^2$  (page 557).

| χ   |  | Common $\log rac{r'}{ar{r}'}$   |  |  |   |                                      |                                       |                                |  |  |  |  |  |

Periodic inequalities of the latitude of Saturn.

We take the terms of  $\Delta\beta'$  given at pages 531, 532, and multiply the co-efficients which involve g'' in their arguments by  $\frac{21000}{22640}$ , and afterwards add the first portion of  $\Delta(\Delta\beta')$  given on page 536. To these can be joined the very small terms due to the action of Neptune (page 179). The whole is then changed to the form adopted in the chapter.

| 1- 1   | 0. 036         | 11 34          |        |                  | 3— 2                                  | 0,004  | 232            |       |                |

We derive f' from  $n'z' = g' + n'\delta z'$  by the formula

 $= n'z' + 23117.434 \sin n'z' + 809.366 \sin 2n'z' + 39.292 \sin 3n'z'$   $+ 2.180 \sin 4n'z' + 0.130 \sin 5n'z' + 0.008 \sin 6n'z'$ 

Then

com. 
$$\log \bar{r}' = 0.97812861 - \text{com. } \log (1 + e' \cos f')$$

In addition,  $l' = f' + \pi'$ , and we derive R' from

$$R' = +97''.774 \sin(2l' + 315^{\circ} 18' 22'') + o''.o23 \sin(4l' + 270^{\circ} 37')$$

The heliocentric longitude of Saturn, referred to the mean equinox of date, is

$$\lambda' = f' + R' + \pi' + 50''.258141t$$

In order to get the equation which determines  $\sin \beta_0'$ , we note that the correction of  $\frac{u'}{\cos i'}$  (page 555), on account of changes in the values of the disturbing masses, requires that the A and B of page 531 should receive severally the corrections -o''.o5o7T and -o''.o662T, so that the equation for  $\cos i' \sin b'$  now becomes

$$\cos i' \sin b' = \begin{bmatrix} 33.3758T + 0.16226T^2 - 0.000858T^3 \end{bmatrix} \sin l' + [-23.9117T + 0.21432T^2 + 0.000641T^3] \cos l'$$

If we add to this the expression for the portion of  $\sin \beta_0'$ , which arises from the motion of the ecliptic (page 531), and also take account of the correction  $-\frac{d(\sin \beta_0')}{dz'} \Delta(\delta z')$ , given at page 536, we obtain

$$\sin \beta_0' = \begin{bmatrix} \sin i_0' \cos \theta_0' + 80.1664 T + 0.06123 T^2 - 0.001471 T^3 \end{bmatrix} \sin l' + [-\sin i_0' \sin \theta_0' - 18.6681 T + 0.42811 T^2 - 0.00027 T^3] \cos l' + [-0.0208 T - 0.00035 T^2] \sin 3l' + [-0.0330 T - 0.00023 T^2] \cos 3l'$$
